1.0 EXECUTIVE SUMMARY

The proposed project, known as 516 La Costa, consists of a hotel with five guest units, twelve bungalow rooms, a spa deck, and a restaurant and bar. The project site is located at 516 La Costa Avenue in the City of Encinitas, California.

The City of Encinitas Noise Element to the General Plan states that noise levels at outdoor use areas of transient lodging (hotel/motel) uses should not exceed 70 CNEL in order to be considered “conditionally acceptable.” A noise analysis was performed to determine anticipated future noise impacts at proposed outdoor use areas on the project site. In order to mitigate noise impacts at outdoor use areas, several sound attenuation barriers are required. The sound attenuation barriers were input into the noise model in locations that would provide shielding from noise associated with traffic traveling on Interstate 5, which is the primary source of noise impacting these receivers. One of the proposed sound barriers should be located toward the north end of the project site and should extend a minimum of 5 feet in height above the finished floor elevation of the restaurant outdoor seating and spa deck areas to attenuate noise levels at these areas. Additionally, a six foot tall sound attenuation barrier should be installed along the eastern property line to mitigate noise impacts to the private outdoor use areas for hotel guests. The balcony barriers on the second floors of each bungalow should also be constructed as sound attenuation barriers with a minimum height of 3.5 feet above the elevation of the balcony floor. Please refer to Section 5.1.1 for more information.

The City of Encinitas and State of California require interior noise levels of 45 CNEL or less in habitable lodging space. Exterior noise levels at many proposed building facades are shown to exceed 60 CNEL. Due to high exterior noise levels at building facades, an exterior-to-interior analysis was performed to determine building features necessary to reduce interior noise levels in residential units to 45 CNEL or less, as required by the State of California and the City of Encinitas. Calculations show that, with the proposed exterior wall assemblies and exterior windows and glass doors with a minimum STC rating of 28, interior noise levels are expected to remain below 45 CNEL in the future noise environment. As the interior noise levels of all lodging units are expected to exceed the 45 CNEL interior noise level requirement with windows open, mechanical ventilation is required in all habitable residential spaces.

The State of California requires that occupied nonresidential spaces demonstrate compliance with the requirements of the California Green Building Standards Code (known as CALGreen). CALGreen requires that where occupied nonresidential spaces are exposed to peak-hour exterior noise levels of greater than 65 dBA, the project must demonstrate building features necessary to reduce interior noise levels to 50 dBA or less in occupied areas during any hour of operation. Occupied nonresidential spaces are expected to comply with CALGreen Building Code regulations using an exterior storefront glazing system with a minimum rating of STC 28.

The City of Encinitas also requires an analysis to determine whether the proposed project will have an adverse noise impact on surrounding properties. Noise limits specified within Section 30.40 of the City of Encinitas Municipal Code must be met at neighboring property lines. The impact of project-generated traffic noise is anticipated to be insignificant at off-site noise-sensitive properties. Additionally, calculations show that noise levels generated by air conditioning units, background music, and persons gathered in proposed outdoor use areas of the project site are expected to be adequately controlled by distance attenuation at surrounding property lines and should remain in compliance with the noise requirements of the City of Encinitas. Therefore, no mitigation is deemed necessary.

Section 9.32.410 of the City of Encinitas Municipal Code restricts the operation of construction equipment to the hours of 7 a.m. to 7 p.m., Mondays through Saturdays. The Municipal Code also states that it is unlawful to operate construction equipment that exceeds a noise level of 75 dBA for more than eight hours during any 24-hour period when measured at residential property lines. Based on the currently proposed construction activities, noise levels are only expected to be 75 dBA or greater at residential property lines when activity is taking place within 35 to 65 feet of the nearest property line, and at all other times will be less than 75 dBA. Due to the large area of the site, this scenario is only expected to take place for very brief periods of time throughout the day, and for this reason, construction limited to the twelve allowable hours of operation established within the code will comply with City of Encinitas noise regulations. General good practice measures should also be followed, including reasonable maintenance of equipment, conservative planning of simultaneous equipment operation, and using equipment with effective mufflers.

2.0 INTRODUCTION

This acoustical analysis report is submitted to satisfy the noise requirements of the City of Encinitas and State of California. Its purpose is to assess noise impacts from nearby roadway traffic and to identify project features or requirements necessary to achieve exterior noise levels of 70 CNEL or less at outdoor use areas, interior noise levels of 45 CNEL or less in habitable lodging space, and interior noise levels of 50 dBA or less in occupied nonresidential space. Additionally, this report assesses noise impacts from potential on-site project-related noise sources, such as mechanical equipment, project-generated traffic, noise from patrons and hotel guests in outdoor use areas, and temporary construction, to determine if mitigation is necessary to reduce the noise impacts to levels that are less than significant or in compliance with applicable standards.

All noise level or sound level values presented herein are expressed in terms of decibels (dB), with A-weighting, abbreviated "dBA," to approximate the hearing sensitivity of humans. Time-averaged noise levels are expressed by the symbol " L_{EQ} ." Unless a different time period is specified, " L_{EQ} " is implied to mean a period of one hour. Some of the data may also be presented as octave-band-filtered and/or 1/3-octave-band-filtered data, which are a series of sound spectra centered about each stated frequency, with half of the bandwidth above and half of the bandwidth below each stated frequency. This data is typically used for machinery noise analysis and barrier calculations.

The Community Noise Equivalent Level (CNEL) is a calculated 24-hour weighted average, where sound levels during evening hours of 7 p.m. to 10 p.m. have an added 5 dB weighting, and sound levels during nighttime hours of 10 p.m. to 7 a.m. have an added 10 dB weighting. This is similar to the Day-Night Sound Level (L_{DN}), which is a 24-hour average with 10 dB added weighting on the same nighttime hours but no added weighting on the evening hours. Sound levels expressed in CNEL are always based on A-weighted decibels. These data unit metrics are used to express noise levels for both measurement and municipal noise ordinances and regulations, for land use guidelines, and enforcement of noise ordinances.

Sound pressure is the actual noise experienced by a human or registered by a sound level instrument. When sound pressure is used to describe a noise source, the distance from the noise source must be specified in order to provide complete information. Sound power, on the other hand, is a specialized analytical metric used to provide information without the distance requirement, and it may be used to calculate the sound pressure at any desired distance.

2.1 Project Description

The proposed project, known as 516 La Costa, consists of a hotel with five guest units, twelve bungalow rooms, a spa deck, and a restaurant and bar, on a lot with a net area of 49,228 square feet. The site is currently occupied by a retail plant nursery.

The project site and surrounding property to the east are zoned Visitor-Serving Commercial (VSC). Properties to the west and south are zoned residential (R-3). The northern boundary of the project site is the Batiquitos Lagoon. For additional project details, please refer to the project plans provided in Appendix A.

2.2 Project Location

The project site is located at 516 La Costa Avenue in the City of Encinitas, California. The Assessor's Parcel Number (APN) for the site is 216-030-48-00. The site is currently occupied by a retail plant nursery. For a graphical representation of the site, please refer to the Vicinity Map, Assessor's Parcel Map, Satellite Aerial Photograph, and Topographic Map, provided as Figures 1 through 4, respectively.

2.3 Applicable Noise Standards

The proposed project must meet the acoustical requirements of the City of Encinitas Noise Element to the General Plan, California Building Code, CALGreen, and City of Encinitas Municipal Code in order to obtain approval.

The City of Encinitas Noise Element to the General Plan considers a noise exposure of 60 to 70 CNEL at a transient lodging (hotel/motel) property to be "Conditionally Acceptable," provided that a detailed analysis is performed to determine the required noise insulation features for the control of interior noise. Interior noise must be controlled to be 45 CNEL or less in habitable lodging space, per City of Encinitas and State of California requirements.

The State of California also requires that occupied nonresidential spaces demonstrate compliance with the requirements of the California Green Building Standards Code (known as CALGreen). CALGreen states that, if noise level readings of 65 dBA L_{EQ} or greater are documented at the proposed project site, the project must either (a) incorporate wall and roof/ceiling assemblies with an STC rating of at least 45 and exterior windows with an STC rating of at least 40, or (b) provide an acoustical analysis documenting interior noise levels do not exceed 50 dBA in occupied areas during any hour of operation. This analysis shows compliance using method b.

Additionally, Per Policy 1.1 of the City of Encinitas Noise Element to the General Plan:

If a project would cause an increase in traffic noise levels, the policy of the City of Encinitas is to accept an increase up to an L_{DN} of 55 dBA in outdoor residential use area without mitigation. If a project would increase the traffic noise level by more than 5 dBA and the resulting L_{DN} would be over 55 dBA, then mitigation measures must be evaluated. If the project, or action, would increase traffic noise levels by 3 dB or more and the resulting L_{DN} would exceed 60 dBA in outdoor use areas in residential development, noise mitigation must be similarly evaluated.

Section 30.40 of the City of Encinitas Municipal Code contains noise limits that would apply to noise sources located on the project site, including air conditioning units and persons located in outdoor use areas. The Municipal Code specifies noise limits based on the zoning of the properties in question. Properties zoned R-3 have noise limits of 50 dBA between the hours of 7 a.m. and 10

p.m. and 45 dBA between the hours of 10 p.m. and 7 a.m. Commercial zones have noise limits of 60 dBA between the hours of 7 a.m. and 10 p.m. and 55 dBA between the hours of 10 p.m. and 7 a.m. As some noise sources are expected to be present during the daytime hours only, while other noise sources are expected to be present during both daytime and nighttime hours, separate analyses of anticipated noise impacts during daytime and nighttime hours have been performed to determine compliance with applicable City of Encinitas noise limits at surrounding properties.

Section 9.32.410 of the City of Encinitas Municipal Code restricts the operation of construction equipment to the hours of 7 a.m. to 7 p.m., Mondays through Saturdays. The Municipal Code also states that it is unlawful to operate construction equipment that exceeds a noise level of 75 dBA for more than eight hours during any 24-hour period when measured at residential property lines.

Pertinent sections of the City of Encinitas Noise Element to the General Plan and Municipal Code, California Building Code, and CALGreen are provided as Appendix B.

3.0 ENVIRONMENTAL SETTING

3.1 Existing Noise Environment

The ambient noise in the vicinity of the project site and neighboring residences is primarily composed of traffic noise from Interstate 5 and associated ramps and La Costa Avenue. No other noise sources are considered significant.

3.1.1 Roadway Traffic Sources

Current traffic volumes for Interstate 5 and associated ramps are given based on information from the San Diego Association of Governments (SANDAG) Series 12 Transportation Forecast Information Center (TFIC), as well as from the Caltrans publication *2016 Traffic Volumes on California State Highways*. Current traffic volumes on La Costa Avenue were obtained from the Transportation Access Study, prepared for this project by Mizuta Traffic Consulting and dated June, 2019. Future (2035) traffic volumes are given based on information from the (SANDAG) Series 12 TFIC. Pertinent sections of the Transportation Access Study have been provided as Appendix C.

La Costa Avenue is a two-lane, two-way Collector running east-west along the south boundary of the project site. The posted speed limit is 35 mph. According to the project traffic study, the current traffic volume on La Costa Avenue in the vicinity of the project site is 15,361 Average Daily Trips (ADT) as of the year 2019.

Interstate 5 (I-5) is an eight-lane, two-way Freeway running north-south to the east of the project site. The posted speed limit is 65 mph. According to Caltrans, the current (year 2016) traffic volume on I-5 is 204,000 ADT traveling northbound and southbound combined. According to SANDAG TFIC Series 12 counts, I-5 currently (year 2008) carries a traffic volume of 88,100 ADT traveling northbound and 84,700 ADT traveling southbound. As counts provided by Caltrans exceed those provided by SANDAG, Caltrans counts have been used for this analysis.

The southbound I-5 off-ramp at La Costa Avenue is a two-lane, one-way Ramp to the east of the project site. The posted speed limit is 30 mph. According to SANDAG, the I-5 southbound off-ramp at La Costa Avenue currently carries approximately 6,700 ADT.

Traffic composition information for Interstate 5 was provided by Caltrans in the 2016 Truck Traffic on California Freeways. The truck percentage mix of 1.89% medium trucks and 2.92% heavy trucks was applied to this roadway, as well as to the associated I-5 off-ramp. No current or future truck percentages were available for La Costa Avenue; however, based on neighboring and surrounding land use, roadway classification, professional experience and on-site observations, a truck percentage mix of 2.0% medium and 1.0% heavy trucks was used for La Costa Avenue.

Current and future traffic volumes for the roadway sections near the project site are shown below in Table 1. For further roadway details and ADT traffic volumes, please refer to Appendix D: Traffic Noise Model (TNM) Data and Results.

Table 1. Overall Traffic Information					
Roadway Name	Speed Limit (mph)	Vehicle Mix (%)		Current ADT (Year)	Future ADT (2035)
		Medium	Heavy		
La Costa Avenue	35	2.0	1.0	15,361 (2019)	19,300
I-5 Southbound	65	1.89	2.92	102,000 (2016)	109,900
I-5 Northbound	65	1.89	2.92	102,000 (2016)	115,400
I-5 Southbound Ramp	30	1.89	2.92	6,700 (2008)	7,400

Traffic noise contours were calculated for the project site using Traffic Noise Model without considering project structures in the current noise environment. Noise contours are irregularly shaped due to the topography of the site and surrounding area and the noise contribution from multiple roadways. The site is exposed to traffic noise levels ranging from approximately 62 CNEL at the west boundary of the project site to 74 CNEL near the northeast corner of the site. For a graphical representation of traffic noise contours, please refer to Figure 5: Site Plan Showing Current Traffic CNEL Contours and Noise Measurement Locations.

3.1.2 Measured Noise Level

An on-site inspection and traffic noise measurement was made on the morning of Thursday, May 10, 2018. The weather conditions were as follows: partly cloudy skies, winds at 8 mph, temperature in the high 60s with moderate humidity. A noise measurement was taken at the southwest corner of the project site at approximately 25 feet north of the La Costa Avenue centerline. The microphone position was approximately five feet above the existing grade. The dominant source of noise during the measurement was traffic noise from La Costa Avenue and Interstate 5, with some noise contribution from activity in the surrounding neighborhood. The measured noise level can be seen in Table 2, and the measurement location is shown graphically on Figures 5 and 6.

Table 2. On-Site Noise Measurement Conditions and Results	
Date	Thursday, May 10, 2018
Time	10:54 a.m. – 11:10 a.m.
Conditions	Partly cloudy skies, winds at 8 mph, temperature in the high 60s with moderate humidity
Measured Noise Level	68.7 dBA L _{EQ}

In addition, long-term noise monitoring was also performed to determine the approximate ambient noise level in the vicinity of the project site. The meter was placed in a bush on the west side of the property, approximately 55 feet north of the La Costa Avenue centerline. Results of this noise monitoring are shown in Table 3, and the noise monitoring location is shown in Figures 5 and 6.

Table 3. Long-Term Measured Noise Levels on Site		
Date	Time	Hourly Average Noise Level (dBA L _{EQ})
May 10, 2018	12 p.m. – 1 p.m.	59.7
	1 p.m. – 2 p.m.	60.5
	2 p.m. – 3 p.m.	58.7
	3 p.m. – 4 p.m.	58.8
	4 p.m. – 5 p.m.	59.8
	5 p.m. – 6 p.m.	60.4
	6 p.m. – 7 p.m.	58.9
	7 p.m. – 8 p.m.	59.1
	8 p.m. – 9 p.m.	58.3
	9 p.m. – 10 p.m.	62.9
	10 p.m. – 11 p.m.	56.6
	11 p.m. – 12 a.m.	55.6
May 11, 2018	12 a.m. – 1 a.m.	51.5
	1 a.m. – 2 a.m.	61.5
	2 a.m. – 3 a.m.	53.4
	3 a.m. – 4 a.m.	51.1
	4 a.m. – 5 a.m.	58.0
	5 a.m. – 6 a.m.	57.8
	6 a.m. – 7 a.m.	60.9
	7 a.m. – 8 a.m.	61.9
	8 a.m. – 9 a.m.	61.5
	9 a.m. – 10 a.m.	59.8
	10 a.m. – 11 a.m.	60.3
	11 a.m. – 12 p.m.	60.0

Measured noise levels were observed to range from 51.1 dBA between the hours of 3 a.m. and 4 a.m. on May 11, to 62.9 dBA between 9 p.m. and 10 p.m. on May 10.

3.1.3 Calculated Noise Level

Noise levels were calculated for the site using the methodology described in Section 4.1.2 for the location, conditions, and traffic volumes counted during the noise measurements. The calculated noise levels (L_{EQ}) were compared with the measured (short-term) on-site noise level to determine if adjustments or corrections (calibration) should be applied to the traffic noise prediction model. Adjustments are intended to account for site-specific differences, such as reflection and absorption, which may be greater or lesser than accounted for in the model.

The measured noise level of 68.7 dBA L_{EQ} was compared to the calculated (modeled) noise level of 68.7 dBA L_{EQ} for the same conditions and traffic flow. According to the Federal Highway Administration's Highway Traffic Noise: Analysis and Abatement Guide (see reference), a traffic noise model is considered validated if the measured and calculated noise impacts differ by three decibels or less. No adjustment was deemed necessary to model future noise levels for this location as the difference between the measured and calculated levels was found to be less than three decibels. The Traffic Noise Model is assumed to be representative of actual traffic noise that is experienced on site. This information is presented in Table 4.

Table 4. Calculated versus Measured Traffic Noise Data				
Location	Calculated	Measured	Difference	Correction
25 feet from La Costa Avenue centerline	68.7 dBA L_{EQ}	68.7 dBA L_{EQ}	0.0 dB	None Applied

3.2 Future Noise Environment

The future on-site noise environment will be the result of the same traffic noise sources, as well as the noise generated by the proposed uses at the project site.

3.2.1 Future Traffic Volumes

The future on-site noise environment will be the result of the same traffic noise sources. The future (year 2035) traffic volumes for surrounding roadways were provided by SANDAG Series 12.

In the vicinity of the project site, the traffic volume of La Costa Avenue is expected to increase to 19,300 ADT. The traffic volume of I-5 is expected to increase to 109,900 ADT traveling southbound (including traffic traveling on proposed HOV lanes) and 115,400 ADT traveling northbound (including traffic traveling on proposed HOV lanes) by the year 2035. The southbound I-5 ramp is expected to carry 7,400 ADT in 2035.

Future traffic noise contours were calculated for the project site using Traffic Noise Model without considering project structures. Noise contours will remain irregularly shaped in the future. The site will be exposed to traffic noise levels ranging from approximately 63 CNEL at the west boundary of the project site to 74 CNEL near the northeast corner of the site. For a graphical representation of traffic noise contours, please refer to Figure 6: Site Plan Showing Future Traffic CNEL Contours and Noise Measurement Locations.

3.2.2 Project-Generated Traffic

The existing plus project on-site noise environment is expected to consist primarily of traffic noise from La Costa Avenue and Interstate 5, in addition to traffic generated by the project. Existing plus project traffic volumes are given based on information from the Traffic Study prepared for this project by Mizuta Traffic Consulting, dated June 2019. Please refer to Appendix C for pertinent sections of the Traffic Assessment. An analysis of noise impacts from project-generated traffic is detailed in Section 5.1.4.

3.2.3 Noise from Persons Gathered in Outdoor Use Areas

The primary potential source of noise associated with the project will be from gatherings in the outdoor use areas, including outdoor restaurant seating, a spa deck, fire pit, and private balconies and patios. Access to the spa deck and private terraces and patios will be restricted to hotel guests

only. Access to the outdoor restaurant seating will be restricted to daytime hours only, while access to private terraces and patios and the spa deck will be allowed during all hours. According to project plans, the outdoor seating area of the restaurant will have a capacity of 46 persons, with 36 patrons near the restaurant and ten near the bar. According to the project proponent, the pool area will have a capacity of 60 persons; private patios located on the first floor of the bungalow and unit buildings will have a capacity of two persons per guestroom, and private balconies located on the second floor of the bungalow buildings will have a capacity of four persons per guestroom. Although unlikely, in order to represent a worst-case scenario, all outdoor use areas were modeled as being at full capacity. The project will need to adhere to the corresponding noise limits of the City of Encinitas.

In order to approximate noise levels of persons gathered in the outdoor use areas of the project, measurements shown in a study prepared by Pearsons, Bennett, and Fidell for the U.S. Environmental Protection Agency titled *Speech Levels in Various Noise Environments* (Report No. EPA-600/1-77-025) were consulted. This study shows noise levels of speech for both males and females for five different vocal efforts: casual, normal, raised, loud, and shout. Measurements for “raised” voices were considered to be appropriate for this analysis. Although a person may occasionally elevate his/her voice beyond the “raised” level, performing calculations assuming all raised voices is expected to account for the occasional loud individual combined with normal conversation. According to this study, at a distance of 3.28 feet, an average male will generate a noise level of approximately 65 dBA when speaking with a raised voice, while an average female will generate a noise level of approximately 63 dBA when speaking with a raised voice. These noise measurements have been incorporated into the analysis of noise impacts detailed in Section 5.2.

3.2.4 Noise from Outdoor Background Music System

In addition to noise associated with persons gathered in outdoor use areas, the project proposes to have outdoor speakers located in various locations on the exterior of the building. These speakers will be used solely to play low levels of background music, and their operation will be limited to during the daytime hours (7 a.m. to 10 p.m.). According to project plans, the project will have a total of eleven outdoor speakers for playing background music, with two located in the fire pit area, six located on the spa deck, and three located in the outdoor restaurant seating area.

A typical music noise spectrum was adjusted to equate to a noise level of 70 dBA, as measured at a distance of 5 feet from the source. This noise level was used to model each outdoor speaker. This noise level is considered to be a conservative estimate of the noise level produced by a background music system. Octave-band noise levels used to model each outdoor speaker are shown below in Table 5.

Table 5. Sound Power Level of Each Outdoor Speaker									
Source	Sound Power Level at Octave Band Frequency (dB)								Total (dBA)
	63	125	250	500	1K	2K	4K	8K	
Background Music	93.6	85.8	77.1	75.9	80.0	72.7	69.7	61.0	82.5

3.2.5 Mechanical Equipment

The primary sources of mechanical noise on the project site will be air conditioning units for the hotel and restaurant spaces. The manufacturer/model of air conditioning units on site is currently unknown, and for this reason, typical assumptions have been made for purposes of this noise analysis. It is assumed that each hotel room would be served by an air conditioning unit with a capacity of approximately 1.5 tons and that units would be ground-mounted. Project plans show that the units will be located at the northwest facade of the bungalow buildings and the east facade of the units. A typical 1.5-ton air conditioning unit manufactured by Carrier has been used in this analysis and is assumed to be representative of equipment that could be used on site in the future. It is assumed that the restaurant will be served by an air conditioning unit with a capacity of approximately 5 tons that would be ground-mounted in the mechanical enclosure to the west of the restaurant building. A typical 5-ton air conditioning unit manufactured by Carrier has been used in this analysis and is assumed to be representative of equipment that could be used on site in the future. Sound power levels for the representative units were provided by the manufacturer. As the summed A-weighted sound power levels do not match the sum of the manufacturer octave-band sound power levels, the octave band sound power levels were adjusted accordingly. Table 6 shows the adjusted sound power levels of the air conditioner unit. Manufacturer data sheets are provided in Appendix E.

Table 6. Sound Power Levels of Carrier 25HCC5 Performance Units								
Source	Sound Power at Octave Band Frequency (dBA)							Total (dBA)
	125	250	500	1K	2K	4K	8K	
25HCC518 (1.5-ton)	50.9	60.4	65.4	67.9	64.9	61.9	53.9	72.0
25HCC560 (5-ton)	59.8	63.8	66.3	68.3	65.3	62.3	57.8	73.0

3.2.6 Temporary Construction Equipment

Detailed construction information was not available at the time this study was prepared; therefore, a typical list of construction equipment used on similar sites has been used for this analysis. Noise impacts for the grading phase of construction are the focus of this analysis, as this stage is when the greatest quantity of heavy construction equipment would be operational on site. Therefore, noise levels at neighboring properties would be at their highest. Unless otherwise noted, construction equipment noise levels were obtained from noise measurements made by Eilar Associates on March 25, 2010 for Brutoco Engineering & Construction, Inc. for the Orange Line Extension Project, Metro Contract #C0943, City of Los Angeles, California. Noise levels are shown in Table 7.

Table 7. Typical Construction Equipment Noise Levels		
Equipment Description	Duty Cycle (%) ¹	Noise Level at 50 feet (dBA)
Front Loader ²	40	72
Backhoe ²	40	74
Grader ²	40	70
Excavator ²	40	75

Table 7. Typical Construction Equipment Noise Levels

4.0 METHODOLOGY AND EQUIPMENT

4.1 Methodology

4.1.1 Field Measurement

Typically, a “one-hour” equivalent sound level measurement (L_{EQ} , A-Weighted) is recorded for at least one noise-sensitive location on the site. During the on-site noise measurement, start and end times are recorded, vehicle counts are made for cars, medium trucks (double-tires/two axles), and heavy trucks (three or more axles) for the corresponding road segment(s). Supplemental sound measurements of one hour or less in duration are often made to further describe the noise environment of the site.

For measurements of less than one hour in duration, the measurement time is long enough for a representative traffic volume to occur and the noise level (L_{EQ}) to stabilize. The vehicle counts are then converted to one-hour equivalent volumes by applying an appropriate factor. Other field data gathered include measuring or estimating distances, angles-of-view, slopes, elevations, roadway grades, and vehicle speeds. This information is subsequently verified using available maps and records.

4.1.2 Roadway Noise Calculation

The Traffic Noise Model, Version 2.5 program, released by the U.S. Department of Transportation, is used to calculate the current and future daytime average CNEL contours at the project site, taking into account surrounding buildings, elevation, and additional topography. The CNEL is calculated as 9.2 percent of the ADT for surrounding roadways, based on the studies made by Wyle Laboratories (see reference). Future CNEL is calculated for desired receptor locations using future road alignment, elevations, lane configurations, projected traffic volumes, estimated truck mixes, and vehicle speeds. Noise attenuation methods may be analyzed, tested, and planned with TNM, as required.

In order to determine the estimated traffic volumes of roadways during the traffic noise measurement made on site for model calibration, the approximate percentage of the Average Daily Trips (ADT) value for the time period in which the measurement is made is incorporated into the traffic model. These percentages have been established in a study performed by Katz-Okitsu and Associates, Traffic Engineers (see reference). For purposes of calibrating the TNM, 6.2% of the

ADT values for the current environment were used in calculations (for roadways that were not manually counted) to account for traffic between the hours of 11 a.m. and 12 p.m. in the vicinity of the project site.

4.1.3 Exterior-to-Interior Analysis

The State of California and the City of Encinitas require buildings to be designed in order to attenuate, control, and maintain average interior noise levels not greater than 45 CNEL in residential space. Contemporary exterior building construction is expected to achieve at least 15 decibels of exterior-to-interior noise attenuation with windows open. As a result, exterior noise levels of more than 60 CNEL often result in interior conditions that fail to meet the 45 CNEL requirements for habitable space.

Analysis for the interior noise levels requires consideration of:

- Number of unique assemblies in the wall (doors, window/wall mount air conditioners, sliding glass doors, and windows)
- Size, number of units, and sound transmission data for each assembly type
- Length of sound impacted wall(s)
- Depth of sound impacted room
- Height of exterior wall of sound impacted room
- Exterior noise level at wall assembly or assemblies of sound impacted room

The Composite Sound Transmission data is developed for the exterior wall(s) and the calculated noise exposure is converted to octave band sound pressure levels (SPL) for a typical traffic type noise. The reduction in room noise due to absorption is calculated and subtracted from the interior octave noise levels, and the octave band noise levels are logarithmically summed to yield the overall interior room noise level. When interior noise levels exceed 45 CNEL in residential space, the noise reduction achieved by each element is reviewed to determine which changes will achieve the most cost-effective compliance. Windows are usually the first to be reviewed, followed by exterior doors, and then exterior walls.

Modeling of wall assemblies is accomplished using INSUL Version 9.0, which is a model-based computer program, developed by Marshall Day Acoustics for predicting the sound insulation of walls, floors, ceilings, and windows. It is acoustically based on theoretical models that require only minimal material information that can make reasonable estimates of the sound transmission loss (TL) and STC for use in sound insulation calculations, such as the design of common party walls and multiple-family floor-ceiling assemblies, etc. INSUL can be used to quickly evaluate new materials or systems or investigate the effects of changes to existing designs. It models individual materials using the simple mass law and coincidence frequency approach and can model more complex assembly partitions as well. It has evolved over several versions into an easy to use tool and has refined the theoretical models by continued comparison with laboratory tests to provide acceptable accuracy for a wide range of constructions. INSUL model performance comparisons with laboratory test data show that the model generally predicts the performance of a given assembly within 3 STC points.

4.1.4 Cadna Noise Modeling

Modeling of the outdoor noise environment is accomplished using Cadna Version 2019, which is a model-based computer program developed by DataKustik for predicting noise impacts in a wide variety of conditions. Cadna (Computer Aided Noise Abatement) assists in the calculation, presentation, assessment, and alleviation of noise exposure. It allows for the input of project

information such as noise source data, barriers, structures, and topography to create a detailed model and uses the most up-to-date calculation standards to predict outdoor noise impacts. Noise standards used by Cadna that are particularly relevant to this analysis include ISO 9613 (Attenuation of sound during propagation outdoors). Cadna provides results that are in line with basic acoustical calculations for distance attenuation and barrier insertion loss.

4.1.5 Formulas and Calculations

Decibel Addition

To determine the combined logarithmic noise level of two known noise source levels, the values are converted to the base values, added together, and then converted back to the final logarithmic value, using the following formula:

$$L_C = 10 \log(10^{L_1/10} + 10^{L_2/10} + K 10^{L_N/10})$$

where L_C = the combined noise level (dB), and
 L_N = the individual noise sources (dB).

This procedure is also valid when used successively for each added noise source beyond the first two. The reverse procedure can be used to estimate the contribution of one source when the contribution of another concurrent source is known and the combined noise level is known. These methods can be used for L_{EQ} or other metrics (such as L_{DN} or CNEL), as long as the same metric is used for all components.

Attenuation Due To Distance

Attenuation due to distance is calculated by the equation:

$$SPL_2 = SPL_1 - 20 \log\left(\frac{D_2}{D_1}\right)$$

where SPL_1 = Known sound pressure level at known distance,
 SPL_2 = Calculated sound pressure level at distance,
 D_1 = Distance from source to location of known sound pressure level, and
 D_2 = Distance from source to location of calculated sound pressure level.

This is identical to the more commonly used reference of 6 dB reduction for every doubling of distance. This equation does not take into account reduction in noise due to atmospheric absorption.

Project-Generated Traffic Noise Impacts

Changes in traffic noise levels can be predicted by inputting the ratio of the two scenarios into the following logarithmic equation:

$$\Delta = 10 \log(V_2/V_1)$$

where: Δ = Change in sound energy,
 V_1 = original or existing traffic volume, and
 V_2 = future or cumulative traffic volume.

Hourly L_{EQ} Summation

To determine the hourly average noise levels (L_{EQ}) when the noise is created for less than the full hour, convert the logarithm values to the base energy value, multiply by the percentage of the hour that the noise occurs, and then convert the sum back to a logarithmic value. This is done with the following formula:

$$L_{EQ} = 10 \log(P_H \times 10^{L_P/10})$$

where P_H = the percent or fraction of the hour noise is created, and
 L_P = the partial hour noise level (dB).

4.2 Measurement Equipment

Some or all of the following equipment was used at the site to measure existing ambient noise levels:

- Larson Davis Sound Expert LxT Type 1 Sound Level Meter, Serial #4085
- Larson Davis Model CA250 Type 1 Calibrator, Serial #1081
- Tripod, microphone & windscreen
- Larson Davis Model 720 Type 2 Sound Level Meter, Serial #0309
- Larson Davis Model CAL150 Type 2 Calibrator, Serial #2056

The sound level meters were field-calibrated immediately prior to the noise measurement and checked afterwards to ensure accuracy. All sound level measurements conducted and presented in this report, in accordance with the regulations, were made with sound level meters that conform to the American National Standards Institute specifications for sound level meters (ANSI S1.4). All instruments are maintained with National Bureau of Standards traceable calibration, per the manufacturers' standards. Please refer to Appendix F for calibration certificates for equipment used to conduct noise measurements on site, which demonstrate that sound level meters and calibrators used for this project were in calibration at the time noise measurements were performed.

5.0 IMPACTS AND MITIGATION

5.1 Traffic Noise Impacts

5.1.1 Exterior Traffic Noise Impacts at Outdoor Use Areas

The City of Encinitas Noise Element to the General Plan states that noise exposure at outdoor use areas of a hotel property should not exceed 70 CNEL in order to be considered "conditionally acceptable."

Future traffic noise impacts at outdoor use areas were calculated at the restaurant outdoor seating, spa deck, fire pit, and personal decks. This analysis considers proposed site topography and building structures. Results are shown in Table 8. A graphical representation of receiver locations is provided as Figure 7.

Table 8. Future Traffic Noise Levels at Outdoor Use Areas		
Receiver	Location	Exterior Noise Level (CNEL)
OU1	Restaurant Deck	68.7
OU2	Restaurant Deck	72.9
OU3	Restaurant Deck	73.6
OU4	Spa Deck	73.0
OU5	Spa Deck	66.0
OU6	Bungalow 1, Floor 1	72.2
OU7	Bungalow 1, Floor 2	73.8
OU8	Bungalow 2, Floor 1	63.9
OU9	Bungalow 2, Floor 2	72.9
OU10	Bungalow 3, Floor 1	60.2
OU11	Bungalow 3, Floor 2	72.5
OU12	Bungalow 4, Floor 1	59.2
OU13	Bungalow 4, Floor 2	71.6
OU14	Fire Pit	60.4
OU15	Unit 5	58.4
OU16	Unit 4	53.3
OU17	Unit 3	53.5
OU18	Unit 2	53.7
OU19	Unit 1	54.9

As shown above, calculations of future noise levels at the proposed outdoor use areas on site show that noise levels are expected to exceed 70 CNEL at multiple outdoor use areas. Mitigation is required for these areas.

In order to mitigate noise impacts at outdoor use areas, several sound attenuation barriers are required. The sound attenuation barriers were input into the noise model in locations that would provide shielding from noise associated with traffic traveling on Interstate 5, which is the primary source of noise impacting these receivers. One of the proposed sound barriers should be located toward the north end of the project site and should extend a minimum of 5 feet in height above the finished floor elevation of the restaurant outdoor seating and spa deck areas to attenuate noise levels at these areas. Additionally, a six foot tall sound attenuation barrier should be installed along the eastern property line to mitigate noise impacts to the private outdoor use areas for hotel guests. The balcony barriers on the second floors of each bungalow should also be constructed as sound attenuation barriers, with a minimum height of 3.5 feet above the elevation of the balcony floor. For a graphical representation of the proposed orientation of the noise barrier walls, please refer to Figure 7. Mitigated noise levels with these barrier walls in place are shown in Table 9.

Table 9. Future Traffic Noise Levels at Outdoor Use Areas – With Barrier Mitigation		
Receiver	Location	Exterior Noise Level (CNEL)
OU2	Restaurant Deck	63.1
OU3	Restaurant Deck	63.3
OU4	Spa Deck	69.7
OU6	Bungalow 1, Floor 1	69.6
OU7	Bungalow 1, Floor 2	68.3
OU9	Bungalow 2, Floor 2	67.2
OU11	Bungalow 3, Floor 2	66.9
OU13	Bungalow 4, Floor 2	66.2

As shown above, with the recommended sound attenuation barrier walls in place, mitigated noise levels at the restaurant outdoor seating and pool areas are expected to be 70 CNEL or less in the future noise environment.

The proposed sound barriers should have the proper height and orientation as shown in Figure 7. The barriers shall be solid and constructed of masonry, wood, plastic, fiberglass, steel, or a combination of those materials, with no cracks or gaps through or below the wall. Any seams or cracks must be filled or caulked. If wood is used, it can be tongue and groove and must be at least 7/8-inch thick or have a surface density of at least 3½ pounds per square foot. Where architectural or aesthetic factors allow, glass or clear plastic may be used on the upper portion if it is desirable to preserve a view. Sheet metal of 18-gauge (minimum) may be used if it meets the other criteria and is properly supported and stiffened so that it does not rattle or create noise itself from vibration or wind. Any door or gate(s) must be designed with overlapping closures on the bottom and sides and meet the minimum specifications of the wall materials described above. The gate(s) may be of 3/4-inch thick or greater wood, solid-sheet metal of at least 18-gauge metal, or an exterior-grade solid-core steel door with prefabricated door jambs.

5.1.2 Exterior Traffic Noise Impacts at Building Facades

Future traffic noise impacts were also calculated at building facades and showed that noise levels will range from 48.3 CNEL at the northwest-facing facade of the first floor of Bungalow 2 to 74.4 CNEL at the northeast-facing facade of the second floor of the restaurant. Noise levels are shown in Table 10, and receiver locations are shown in Figure 8.

Table 10. Future Traffic Noise Levels at Building Facades

5.1.3 Interior Traffic Noise Impacts

The City of Encinitas Noise Element to the General Plan and the State of California require buildings to be designed in order to attenuate, control, and maintain interior noise levels to 45 CNEL or less in habitable lodging space. CALGreen requires that nonresidential structures that are exposed to greater than 65 dBA during any hour of operation must control interior noise levels to be 50 dBA or less in occupied nonresidential spaces. Current exterior building construction is generally expected to achieve at least 15 decibels of exterior-to-interior noise attenuation with windows opened, according to the U.S. EPA (see reference). Therefore, proposed project building structures exposed to exterior noise levels greater than 60 CNEL could be subject to interior noise levels exceeding the 45 CNEL noise limit in habitable residential or commercial space. According to the California Department of Transportation's Technical Noise Supplement to the Traffic Noise Analysis Protocol (see reference), peak hour traffic noise levels are typically found to be close to predicted CNEL values. Therefore, CNEL values calculated in the traffic noise analysis for this project (shown in Table 10) have been considered to be representative of peak hour noise impacts that would be experienced at on-site nonresidential suites.

The proposed exterior wall assembly is expected to be constructed as a wood-framed assembly with wood, stucco, concrete, or metal on the exterior, insulation in the cavity, and one layer of 5/8-inch thick Type X gypsum board on the interior. The wood exterior wall assembly (Wall Type E) was evaluated using INSUL and was shown to achieve an STC rating of 32. The stucco exterior wall assembly (Wall Type D) was evaluated using INSUL and was shown to achieve an STC rating of 38. The concrete exterior wall assembly (Wall Type B1) was evaluated using INSUL and was shown to achieve an STC rating of 40. The metal exterior wall assembly (Wall Type A) was evaluated using INSUL and was shown to achieve an STC rating of 55. Please refer to Appendix G for more details. These proposed exterior wall assemblies were incorporated into exterior-to-interior noise calculations.

Habitable Lodging Units

Calculations show that future noise levels on site exceed 60 CNEL at many facades; therefore, interior noise levels may exceed 45 CNEL with windows open. Due to high noise levels on-site, an exterior-to-interior analysis was performed to determine building features necessary to reduce interior noise levels in occupied spaces to 45 CNEL or less in residential space. The results of the exterior-to-interior noise analysis for each room are shown in Table 11, with acoustical recommendations made therein. For more information, please refer to Appendix H: Exterior-to-Interior Noise Analysis.

Table 11. Future Interior Noise Levels with Mitigation Recommendations						
Building	Room	Maximum Exterior Facade Impact (CNEL)	Minimum STC Rating for Windows/ Glass Doors	Interior Noise Level (CNEL)		Mechanical Ventilation
				Windows Open	Windows Closed	
Bungalow	Unit Type A	72.9	28	64.2	43.9	Required
	Unit Type B	74.2	28	56.7	43.3	Required
Unit	Kitchen / Dining / Loft	71.6	28	57.6	44.4	Required
	Bedroom	68.5	28	--	38.2	Required

As shown above, all units are expected to have interior noise levels of 45 CNEL or less with the proposed exterior wall and STC 28 windows and glass doors in place. Calculations show that none of the lodging spaces will comply with the City of Encinitas and State of California interior noise regulations with windows and doors open; hence, mechanical ventilation will be required in these units. The mechanical ventilation system shall meet the criteria of the California Mechanical Code, including the capability to provide appropriate ventilation rates. The ventilation system shall not compromise the sound insulation capability of the exterior wall or be dependent on ventilation through open windows.

Exterior door installation should include all-around weather-tight door stop seals and an improved threshold closure system. The additional hardware will improve the doors' overall sound reduction properties. The transmission loss (TL) of an exterior door without weather-tight seals is largely a factor of sound leakage, particularly at the bottom of the door if excessive clearance is allowed for air transfer. By equipping exterior doors with all-around weather-tight seals and an airtight threshold closure at the bottom, a loss of up to 10 STC points can be prevented.

Additionally, it is imperative to seal and caulk between the rough opening and the finished door frame for all doors by applying an acoustically resilient, non-skinning, butyl caulking compound. Sealant application should be as generous as needed to ensure effective sound barrier isolation. The same recommendation applies to any other penetrations, cracks, or gaps through the assembly. The OSI SC175 and the Pecora AC-20 FTR acoustic sound sealants are products specifically designed for this purpose. For additional information on these products, please refer to Appendix I: Recommended Products.

The proposed residential units were analyzed for future traffic noise impacts. With the proposed exterior wall assemblies, window and door configurations specified above, and mechanical ventilation, all interior, habitable, lodging spaces are expected to comply with City of Encinitas and California Building Code noise requirements.

Nonresidential Spaces (CALGreen)

CALGreen requires that nonresidential structures that are exposed to greater than 65 dBA during any hour of operation must control interior noise levels to be 50 dBA or less. Contemporary exterior building construction is expected to achieve at least 15 decibels of exterior-to-interior noise attenuation with windows opened. As a result, exterior noise levels of more than 65 dBA can result in interior conditions that fail to meet the 50 dBA requirement for nonresidential space. According to the California Department of Transportation's Technical Noise Supplement to the Traffic Noise

Analysis Protocol (see reference), peak hour traffic noise levels are typically found to be close to predicted CNEL values. Therefore, CNEL values calculated in the traffic noise analysis for this project (shown in Appendix D) have been considered to be representative of peak hour noise impacts that would be experienced at on-site nonresidential suites.

An exterior-to-interior noise analysis was conducted for occupied nonresidential spaces located throughout the restaurant building. Proposed exterior walls detailed above were used for exterior-to-interior noise calculations. Please refer to Table 12, showing interior noise levels with these considerations taken into account, and refer to Appendix H for additional information.

Table 12. Future Interior Noise Levels with Mitigation Recommendations – Commercial Spaces			
Room	Maximum Exterior Facade Impact (CNEL)	Minimum STC Rating for Windows/Glass Doors	Interior Noise Level (CNEL)
Front Desk / Bar	74.4	28	44.1
Dining	74.3	28	45.4

As shown above, all occupied nonresidential spaces are expected to have peak-hour interior noise levels of 50 dBA L_{EQ} or less with exterior glazing with a minimum STC rating of 28.

Exterior door installation should include all-around weather-tight door stop seals and an improved threshold closure system. The additional hardware will improve the doors' overall sound reduction properties. The transmission loss (TL) of an exterior door without weather-tight seals is largely a factor of sound leakage, particularly at the bottom of the door if excessive clearance is allowed for air transfer. By equipping exterior doors with all-around weather-tight seals and an airtight threshold closure at the bottom, a loss of up to 10 STC points can be prevented.

Additionally, it is imperative to seal and caulk between the rough opening and the finished door frame for all doors by applying an acoustically resilient, non-skinning, butyl caulking compound. Sealant application should be as generous as needed to ensure effective sound barrier isolation. The same recommendation applies to any other penetrations, cracks, or gaps through the assembly. The OSI SC175 and the Pecora AC-20 FTR acoustic sound sealants are products specifically designed for this purpose. For additional information on these products, please refer to Appendix I: Recommended Products.

The proposed interior spaces were analyzed for future exterior noise impacts from roadway traffic. With the proposed exterior wall assemblies and exterior windows and glass doors meeting the minimum STC 28 rating, all occupied nonresidential space is expected to comply with CALGreen noise requirements.

5.1.4 Traffic Noise Impacts on Sensitive Receivers

Per Policy 1.1 of the City of Encinitas Noise Element to the General Plan:

If a project would cause an increase in traffic noise levels, the policy of the City of Encinitas is to accept an increase up to an L_{DN} of 55 dBA in outdoor residential use area without mitigation. If a project would increase the traffic noise level by more than 5 dBA and the resulting L_{DN} would be over 55 dBA, then mitigation measures must be evaluated. If the project, or action, would increase

traffic noise levels by 3 dB or more and the resulting L_{DN} would exceed 60 dBA in outdoor use areas in residential development, noise mitigation must be similarly evaluated.

Permanent project-generated traffic noise impacts were evaluated to determine whether the project-related traffic will increase traffic noise levels in the vicinity of the project site.

Using projected traffic volumes provided in the Traffic Study prepared by Mizuta Traffic Consulting, existing traffic volumes (peak hour) were compared to existing plus project traffic volumes (peak hour) as calculated within this transportation impact analysis to determine the projection of traffic noise impacts generated by the project.

Project-generated traffic noise impacts were calculated using the Project-Generated Traffic Noise Impacts formula shown in Section 4.1.5. Impacts were calculated at the two major intersections closest in proximity to the proposed project: the intersection of La Costa Avenue and the southbound I-5 off ramp, and the intersection of La Costa Avenue and Vulcan Avenue.

Calculations show that, at the intersection of La Costa Avenue and the southbound I-5 off ramp, there is expected to be no net increase in noise levels due to project-generated traffic. At the intersection of La Costa Avenue and Vulcan Avenue, calculations show that there is expected to be no net increase in noise levels due to project-generated traffic. For more information, please refer to Appendix J: Project-Generated Traffic Noise Calculations. As project-generated traffic is not expected to increase traffic noise levels, no mitigation is required.

5.2 Operational Noise Sources

Noise sources associated with the operation of the proposed project include mechanical equipment as well as noise from persons gathered in outdoor use areas of the project. Noise impacts from these sources were calculated at the nearest surrounding property lines using Cadna.

It is assumed that each hotel room would be served by an air conditioning unit with a capacity of approximately 1.5 tons and that units would be ground-mounted. Project plans show that the units will be located at the northwest facade of the bungalow buildings and the east facade of the units. It is also assumed that the restaurant will be served by an air conditioning unit with a capacity of approximately 5 tons that would be ground-mounted in the mechanical equipment enclosure to the west of the restaurant building. Although mechanical equipment would be expected to cycle on and off throughout the day and night, mechanical equipment was modeled as running continuously, in order to represent a worst-case analysis. As air conditioning equipment may operate during nighttime hours, noise impacts will be compared to the most restrictive nighttime noise limits to determine compliance.

In order to predict anticipated maximum noise impacts from persons gathered in outdoor use areas, all noise sources were calculated as raised voices, with half of the persons modeled as female, and the other half modeled as male. Each noise source (person) was calculated as speaking for 30 minutes out of every hour, which is considered excessive as each patron is expected to take breaks in conversation for listening, eating, drinking, et cetera. For this reason, this analysis is considered to be a conservative estimate of noise levels generated at outdoor use areas and accounts for occasional bursts of louder noise combined with times of lesser noise. Noise levels were evaluated with the outdoor use areas at the capacities listed above in Section 3.2.3.

In addition to noise associated with persons gathered in outdoor use areas, the project proposes to have outdoor speakers located in various locations on the exterior of the building. These speakers will be used solely to play low levels of background music, and their operation will be limited to during the daytime hours (7 a.m. to 10 p.m.). According to project plans, the project will have a total of eleven outdoor speakers for playing background music, with two located in the fire pit area, six

located on the spa deck, and three located in the outdoor restaurant seating area. These speakers were incorporated into plans as such. No additional outdoor amplified events are proposed at the project site.

Results are shown in Table 13 and calculation sheets are provided in Appendix K. For a graphical representation of noise contours associated with the operation of the proposed project during the daytime and nighttime hours, as well as source and receiver locations, please refer to Figures 9 and 10, respectively.

Table 13. Operational Noise Impacts					
Receiver	Description	Noise Limit (dBA L_{EQ})		Calculated Noise Level (dBA L_{EQ})	
		Daytime	Nighttime	Daytime	Nighttime
R1	South Property Line	50	45	33.4	33.3
R2	East Property Line – South	60	55	45.9	45.9
R3	East Property Line – North	60	55	40.6	41.5
R4	West Property Line – North	50	45	44.7	28.0
R5	West Property Line – South	50	45	41.8	39.2

As show above in Table 13, noise impacts associated with the operation of the proposed project are expected to comply with applicable City of Encinitas noise limits at surrounding properties. It should also be noted that these noise levels are expected to be less than the existing ambient noise environment at most receivers in the vicinity of the project site. No additional mitigation is deemed necessary for attenuating noise from the operation of the proposed facility.

5.3 Temporary Construction Noise

Temporary construction noise is expected to be at its highest during grading operations, when the greatest quantity of heavy equipment would be located on site. The City of Encinitas requires that noise levels from construction activity do not exceed 75 dBA for more than eight hours and that construction activity is limited to the hours of 7 a.m. to 7 p.m., Mondays through Saturdays. As detailed in Section 3.2.6, noise levels from construction equipment during grading activities are expected to range from 72 to 77 dBA at 50 feet from the equipment. Considering these equipment noise levels, construction activity noise levels are only expected to be 75 dBA or greater at residential property lines when activity is taking place within 35 to 65 feet of the nearest property line, and at all other times will be less than 75 dBA. Due to the large area of the site, this scenario is only expected to take place for very brief periods of time throughout the day, and for this reason, construction limited to the twelve allowable hours of operation established within the code will comply with City of Encinitas noise regulations.

No sound attenuation barriers are therefore deemed necessary to reduce temporary noise impacts. The following measures should still be practiced as a courtesy to residential neighbors.

1. Construction activity must be limited to the hours of 7 a.m. to 7 p.m., Mondays through Saturdays, as per the City of Encinitas Municipal Code.
2. Staging areas should be placed as far from occupied receivers as possible on the project site to limit any additional unnecessary noise exposure at sensitive receivers.

3. Place stationary equipment in locations that will have a lesser noise impact on nearby sensitive receivers.
4. Turn off equipment when not in use.
5. Limit the use of enunciators or public address systems, except for emergency notifications.
6. Equipment used in construction should be maintained in proper operating condition, and all loads should be properly secured to prevent rattling and banging.
7. Schedule work to avoid simultaneous construction activities that both generate high noise levels.
8. Use equipment with effective mufflers.
9. Minimize the use of backup alarms.

With work limited to those allowable by the City of Encinitas, temporary construction noise will not exceed the applicable thresholds of the City of Encinitas Municipal Code.

6.0 CONCLUSION

The City of Encinitas Noise Element to the General Plan states that noise levels at outdoor use areas of transient lodging (hotel/motel) uses should not exceed 70 CNEL in order to be considered “conditionally acceptable.” A noise analysis was performed to determine anticipated future noise impacts at proposed outdoor use areas on the project site. In order to mitigate noise impacts at outdoor use areas, several sound attenuation barriers are required. The sound attenuation barriers were input into the noise model in locations that would provide shielding from noise associated with traffic traveling on Interstate 5, which is the primary source of noise impacting these receivers. One of the proposed sound barriers should be located toward the north end of the project site and should extend a minimum of 5 feet in height above the finished floor elevation of the restaurant outdoor seating and spa deck areas to attenuate noise levels at these areas. Additionally, a six foot tall sound attenuation barrier should be installed along the eastern property line to mitigate noise impacts to the private outdoor use areas for hotel guests. The balcony barriers on the second floors of each bungalow should also be constructed as sound attenuation barriers, with a minimum height of 3.5 feet above the elevation of the balcony floor. Please refer to Section 5.1.1 for more information.

The City of Encinitas and State of California require interior noise levels of 45 CNEL or less in habitable lodging space. Calculations show that, with the proposed exterior wall assemblies and exterior windows and glass doors with minimum a minimum STC rating of 28, interior noise levels are expected to remain below 45 CNEL in the future noise environment. As the interior noise levels of all lodging units are expected to exceed the 45 CNEL interior noise level requirement with windows open, mechanical ventilation is required in all habitable residential spaces.

The State of California requires that occupied nonresidential spaces demonstrate compliance with the requirements of the California Green Building Standards Code (known as CALGreen). Occupied nonresidential spaces are expected to comply with CALGreen Building Code regulations using an exterior storefront glazing system with a minimum rating of STC 28.

The City of Encinitas also requires an analysis to determine whether the proposed project will have an adverse noise impact on surrounding properties. Noise limits specified within Section 30.40 of the City of Encinitas Municipal Code must be met at neighboring property lines. The impact of project-generated traffic noise is anticipated to be insignificant at off-site noise-sensitive properties. Additionally, calculations show that noise levels generated by air conditioning units, background music, and persons gathered in proposed outdoor use areas of the project site are expected to be adequately controlled by distance attenuation at surrounding property lines and, therefore, should remain in compliance with the noise requirements of the City of Encinitas. No mitigation is deemed necessary.

Section 9.32.410 of the City of Encinitas Municipal Code restricts the operation of construction equipment to the hours of 7 a.m. to 7 p.m., Mondays through Saturdays. The Municipal Code also states that it is unlawful to operate construction equipment that exceeds a noise level of 75 dBA for more than eight hours during any 24-hour period when measured at residential property lines. Based on the currently proposed construction activities, noise levels are only expected to be 75 dBA or greater at residential property lines when activity is taking place within 35 to 65 feet of the nearest property line, and at all other times will be less than 75 dBA. Due to the large area of the site, this scenario is only expected to take place for very brief periods of time throughout the day, and for this reason, construction limited to the twelve allowable hours of operation established within the code will comply with City of Encinitas noise regulations. General good practice measures should also be followed, including reasonable maintenance of equipment, conservative planning of simultaneous equipment operation, and using equipment with effective mufflers.

These conclusions and recommendations are based on the best and most current project-related information available at the time this study was prepared.

7.0 CERTIFICATION

All recommendations for noise control are based on the best information available at the time our consulting services are provided. However, as there are many factors involved in sound transmission, and Eilar Associates has no control over the construction, workmanship, or materials, Eilar Associates is specifically not liable for final results of any recommendations or implementation of the recommendations.

This report is based on the related project information received and measured noise levels, and represents a true and factual analysis of the acoustical issues associated with the 516 La Costa Project in the City of Encinitas, California. This report was prepared by Mo Ouwenga and Jonathan Brothers.

Mo Ouwenga, Acoustical Consultant

Jonathan Brothers, Principal Acoustical Consultant

GENERAL NOTES

- COMPLIANCE WITH THE DOCUMENTATION REQUIREMENTS OF THE 2016 ENERGY EFFICIENCY STANDARDS IS NECESSARY FOR THIS PROJECT. REGISTERED, SIGNED, AND DATED COPIES OF THE APPROPRIATE CF1R, CF2R, AND CF3R FORMS SHALL BE MADE AVAILABLE FOR THE BUILDING OWNER.

- ALL STRUCTURES SHALL BE PROVIDED WITH A CLASS "A" ROOF COVERING TO THE SATISFACTION OF THE ENCINITAS FIRE DEPARTMENT

DEFERRED SUBMITTAL

-FIRE SPRINKLER SYSTEM, FIRE ALARM SYSTEM, POOL

FIRE ALARM SYSTEM

EXISTING AUTOMATIC FIRE ALARM SYSTEM SHALL REMAIN AND BE VERIFIED FOR COMPLIANCE FIRE CODE AND WITH SECTION 901 OF CBC. AS PER N.F.P.A.72, THE MOST CURRENT EDITION SHALL BE USED & THE ENCINITAS FIRE DEPT. POLICIES. FIRE. ANY NEW FIRE ALARM INSTALLATION MUST BE BY A C10 LICENSED ALARM CONTRACTOR. CALIFORNIA FIRE CODE AND ENCINITAS FIRE DEPARTMENT REQUIREMENTS

AUTOMATIC FIRE SPRINKLER SYSTEM

EXISTING AUTOMATIC FIRE SPRINKLER SYSTEM SHALL BE VERIFIED FOR THE COMPLIANCE WITH SECTION 901 OF THE CBC. AS PER N.F.P.A. 13R, THE MOST CURRENT EDITION SHALL BE USED & THE ENCINITAS FIRE DEPT. POLICIES. SPRINKLER PLANS SHALL BE SUBMITTED TO THE PREVENTION BUREAU & APPROVED FOR COMPLIANCE IF MORE THAN 10 SPRINKLER HEADS ARE MOVED. ANY NEW SPRINKLER HEADS INSTALLATION MUST BE BY A C16 LICENSED SPRINKLER CONTRACTOR. STRUCTURES SHALL BE PROTECTED BY AN AUTOMATIC FIRE SPRINKLER SYSTEM DESIGN AND INSTALLED TO THE SATISFACTION OF THEFIRE DEPARTMENT. A CLASS 1 OR CLASS II COMBINED WET STANDPIPE SYSTEM IS REQUIRED. STANDPIP SYSTEM SHALL BE DESIGNED AND INSTALLED TO THE SATISFACTION OF THE FIRE DEPARTMENT. EXISTING STANDPIPE SHALL BE VERIFIED TO MEET STANDARDS.

APPENDIX B

Pertinent Sections of the City of Encinitas Noise Element to the General Plan and Municipal Code, California Building Code, and CALGreen

Figure 17-1 State of California Guidelines for Noise Compatible Land Use

Source: State of California. (2003). *General Plan Guidelines*. Governor's Office of Planning and Research. October

- The interior noise level as required by the State of California Noise Insulation Standards [CCR Title 24] must not exceed an Ldn of 45 dB in multi-family dwellings. This interior standard shall also be applied to single family dwellings and offices in the City of Encinitas.

Other Noise Guidelines

The Collaborative for High Performance Schools (CHPS) is a non-profit organization dedicated to making schools better places to learn. CHPS was initially founded in 1999 as a collaboration of California's major utilities to address energy efficiency in schools. The program quickly expanded to address all aspects of school design, construction and operation including noise. The CHPS *California 2009 Criteria for New Construction and Major Modernizations* specify that the maximum background noise level in unoccupied classrooms should not exceed 45 dB(A) and strongly recommends designs that would achieve background levels no greater than 35 dB(A). Background interior noise in schools is considered to be primarily due to heating, ventilation, and air conditioning (HVAC) systems and exterior noise sources such as traffic.

The Acoustical Society of America (ASA) and the American National Standards Institute (ANSI) have developed *ANSI/ASA S12.60-2010/Part 1 - Acoustical Performance Criteria, Design Requirements, and Guidelines for Schools, Part 1: Permanent Schools*. This voluntary standard specifies an interior background one-hour average noise level due to exterior sources of 35 dB(A) in classrooms.

17.5 PLANNING GOALS AND POLICIES

Applicable goals and policies contained in the existing General Plan relevant to noise are found in the Noise Element as listed in Table 17-7.

Table 17-7 Resource Management Element Policies Related to Noise

Policy	Description
Goal 1	Provide an acceptable noise environment for existing and future residents of the City of Encinitas
1.1	<p>Review actions or projects that may have noise generation potential to determine what impact they may have on existing land uses. If a project would cause an increase in traffic noise levels, the policy of the City of Encinitas is to accept an increase up to an L_{dn} of 55 dB in outdoor residential use areas without mitigation. If a project would increase the traffic noise level by more than 5 dB and the resulting L_{dn} would be over 55 dB, then mitigation measures must be evaluated. If the project, or action, would increase traffic noise levels by 3 dB or more and the resulting L_{dn} would exceed 60 dB in outdoor use areas in residential development, noise mitigation must be similarly evaluated. The impact of non-transportation projects must generally be evaluated on a case-by-case basis. The following guidelines will aid in evaluating the impacts of commercial and industrial projects.</p> <ul style="list-style-type: none"> a) <u>Performance Standards Adjacent to Residential Areas.</u> New commercial construction adjacent to residential areas should not increase noise levels in a residential area by more than 3 dB (L_{dn}) or create noise impacts which would increase noise levels to more than an L_{dn} of 60 dB at the boundary of the nearest residential area, whichever is more restrictive. b) <u>Performance Standards Adjacent to Commercial and Industrial Areas.</u> New commercial projects should not increase noise levels in a commercial area by more than 5 dB (L_{dn}) or increase noise levels to an L_{dn} in excess of 70 dB (office buildings, business and professional) or an L_{dn} of 75 dB (industrial) at the property line of an adjacent commercial/industrial use, whichever is more restrictive.

CHAPTER 30.40
PERFORMANCE STANDARDS

30.40.010. PURPOSE

In order to minimize the adverse impacts of certain nuisance factors and to provide methods of determining compatibility between uses of land and buildings, the following performance standards are established. (Ord. 90-04)

A. NOISE

1. Every use shall be so operated that the noise generated does not exceed the following levels at or beyond the lot line and does not exceed the limits of any adjacent zone.

Adjacent Zone	One Hour Average Sound Level	
	7am-10pm	10pm-7am
RR, RR-1, RR-2, R-3, R-5, R-8	50 dB	45 dB
R-11, RS-11, R-15, R-20, R-25, MHP	55 dB	50 dB
OP, LLC, LC, GC L-VSC, VSC	60 dB	55 dB
L-I, BP	60 dB	55 dB

2. ER/OS/PK - Will be governed by the limits applicable to the source of the complaint.
3. The interior noise level as required by the State of California Noise Insulation Standards must not exceed an LDN of 45 dB in multi-family dwellings. This interior standard shall also be applied to single family dwellings and offices in the City of Encinitas.
4. It shall be unlawful for any person on any property within the City to create any noise, or to allow the creation of any noise on property owned, leased,

occupied, or otherwise controlled by such person, which causes the noise level when measured on any other property to exceed the following:

- a. The noise standard for cumulative period of more than 30 minutes in any hour; or
- b. The noise standard plus 5 dB for a cumulative period of more than 15 minutes in any hour; or
- c. The noise standard plus up to 15 dB for a cumulative period of more than 1 minute in any hour; or
- d. The noise standard plus 20 dB for any period of time.

5. For the purpose of this Chapter, the peak decibel reading for a noise with a fluctuating noise level (such as live or recorded music) shall be considered as the noise level for the entire cumulative period of the noise. Likewise, the time between repetitive intermittent noises (such as banging, pounding, or hammering) shall be included in the cumulative of the noise.

B. VIBRATION

Every use shall be so operated that the ground vibration generated at any time and measured at any point along the lot line of the lot on which the use is located shall not be perceptible and shall not exceed the following:

Adjacent Zone	Vibration in Inches per Second	
	Impact	Steady-State
Residential	.006	.003
Commercial	.010	.005
Light Industrial	.040	.020
Public/Semi-Public	.010	.005

C. RADIOACTIVITY AND ELECTRICAL DISTURBANCES (Ord. 90-07)

1. Except with the prior approval of the City as to specific uses, the use of radioactive materials within any zone shall be limited to measuring, gauging, and calibration devices, as tracer elements in X-ray and like

Encinitas Municipal Code[Up](#)[Previous](#)[Next](#)[Main](#)[Search](#)[Print](#)[No Frames](#)[Title 9 PUBLIC SAFETY, PEACE, AND WELFARE](#)[Chapter 9.32 NOISE ABATEMENT AND CONTROL](#)**9.32.410 Construction Equipment.**

Except for emergency work, it shall be unlawful for any person, including the City, to operate construction equipment at any construction site, except as outlined in subsections A and B of this section:

A. It shall be unlawful for any person, including the City, to operate construction equipment at any construction site on Sundays, and days appointed by the President, Governor or the City Council for a public fast, thanksgiving or holiday. Notwithstanding the above, a person may operate construction equipment on the above-specified days between the hours of 10:00 a.m. and 5:00 p.m. in compliance with the requirements of subsection B of this section at his or her residence or for the purpose of constructing a residence for him or herself, provided such operation of construction equipment is not carried on for profit or livelihood. In addition, it shall be unlawful for any person to operate construction equipment at any construction site on Mondays through Saturdays except between the hours of 7:00 a.m. and 7:00 p.m.

B. No such equipment, or combination of equipment regardless of age or date of acquisition, shall be operated so as to cause noise at a level in excess of 75 decibels for more than eight hours during any 24-hour period when measured at or within the property lines of any property which is developed and used either in part or in whole for residential purposes.

In the event that lower noise limit standards are established for construction equipment pursuant to state or federal law, said lower limits shall be used as a basis for revising and amending the noise level limits specified in this subsection.

View the [mobile version](#).

1206.3 Courts. Courts shall be not less than 3 feet (914 mm) in width. Courts having windows opening on opposite sides shall be not less than 6 feet (1829 mm) in width. Courts shall be not less than 10 feet (3048 mm) in length unless bounded on one end by a public way or yard. For buildings more than two stories above grade plane, the court shall be increased 1 foot (305 mm) in width and 2 feet (610 mm) in length for each additional story. For buildings exceeding 14 stories above grade plane, the required dimensions shall be computed on the basis of 14 stories above grade plane.

1206.3.1 Court access. Access shall be provided to the bottom of courts for cleaning purposes.

1206.3.2 Air intake. Courts more than two stories in height shall be provided with a horizontal air intake at the bottom not less than 10 square feet (0.93 m²) in area and leading to the exterior of the building unless abutting a yard or public way.

1206.3.3 Court drainage. The bottom of every court shall be properly graded and drained to a public sewer or other approved disposal system complying with the *California Plumbing Code*.

SECTION 1207 SOUND TRANSMISSION

1207.1 Scope. This section shall apply to common interior walls, partitions and floor/ceiling assemblies between adjacent dwelling units and sleeping units or between dwelling units and sleeping units and adjacent public areas such as halls, corridors, stairways or service areas.

1207.2 Air-borne sound. Walls, partitions and floor/ceiling assemblies separating dwelling units and sleeping units from each other or from public or service areas shall have a sound transmission class of not less than 50, or not less than 45 if field tested, for air-borne noise when tested in accordance with ASTM E90. Penetrations or openings in construction assemblies for piping; electrical devices; recessed cabinets; bathtubs; soffits; or heating, ventilating or exhaust ducts shall be sealed, lined, insulated or otherwise treated to maintain the required ratings. This requirement shall not apply to entrance doors; however, such doors shall be tight fitting to the frame and sill.

1207.2.1 Masonry. The sound transmission class of concrete masonry and clay masonry assemblies shall be calculated in accordance with TMS 0302 or determined through testing in accordance with ASTM E90.

1207.3 Structure-borne sound. Floor/ceiling assemblies between dwelling units and sleeping units or between a dwelling unit or sleeping unit and a public or service area within the structure shall have an impact insulation class rating of not less than 50, or not less than 45 if field tested, when tested in accordance with ASTM E492.

Exception: Impact sound insulation is not required for floor-ceiling assemblies over nonhabitable rooms or spaces not designed to be occupied, such as garages, mechanical rooms or storage areas.

1207.4 Allowable interior noise levels. Interior noise levels attributable to exterior sources shall not exceed 45 dB in any

habitable room. The noise metric shall be either the day-night average sound level (L_{dn}) or the community noise equivalent level (CNEL), consistent with the noise element of the local general plan.

1207.5 Acoustical control. [BSC-CG] See *California Green Building Standards Code, Chapter 5, Division 5.5* for additional sound transmission requirements.

SECTION 1208 INTERIOR SPACE DIMENSIONS

1208.1 Minimum room widths. Habitable spaces, other than a kitchen, shall be not less than 7 feet (2134 mm) in any plan dimension. Kitchens shall have a clear passageway of not less than 3 feet (914 mm) between counter fronts and appliances or counter fronts and walls.

[HCD 1] For limited-density owner-built rural dwellings, there shall be no requirements for room dimensions, provided there is adequate light and ventilation and adequate means of egress.

1208.2 Minimum ceiling heights. Occupiable spaces, habitable spaces and corridors shall have a ceiling height of not less than 7 feet 6 inches (2286 mm). Bathrooms, toilet rooms, kitchens, storage rooms and laundry rooms shall have a ceiling height of not less than 7 feet (2134 mm).

Exceptions:

1. In one- and two-family dwellings, beams or girders spaced not less than 4 feet (1219 mm) on center shall be permitted to project not more than 6 inches (152 mm) below the required ceiling height.
2. If any room in a building has a sloped ceiling, the prescribed ceiling height for the room is required in one-half the area thereof. Any portion of the room measuring less than 5 feet (1524 mm) from the finished floor to the ceiling shall not be included in any computation of the minimum area thereof.
3. The height of mezzanines and spaces below mezzanines shall be in accordance with Section 505.1.
4. Corridors contained within a dwelling unit or sleeping unit in a Group R occupancy shall have a ceiling height of not less than 7 feet (2134 mm).
5. [OSHPD 1, 2 & 3] Minimum ceiling heights shall comply with Section 1224.4.10.
6. [OSHPD 4] Minimum ceiling heights shall comply with Section 1227.8.

1208.2.1 Furred ceiling. Any room with a furred ceiling shall be required to have the minimum ceiling height in two-thirds of the area thereof, but in no case shall the height of the furred ceiling be less than 7 feet (2134 mm).

1208.3 Room area. Every dwelling unit shall have no fewer than one room that shall have not less than 120 square feet (13.9 m²) of net floor area. Other habitable rooms shall have a net floor area of not less than 70 square feet (6.5 m²).

Exception: Kitchens are not required to be of a minimum floor area.

5.504.7 Environmental tobacco smoke (ETS) control. Where outdoor areas are provided for smoking, prohibit smoking within 25 feet of building entries, outdoor air intakes and operable windows and within the building as already prohibited by other laws or regulations; or as enforced by ordinances, regulations or policies of any city, county, city and county, California Community College, campus of the California State University, or campus of the University of California, whichever are more stringent. When ordinances, regulations or policies are not in place, post signage to inform building occupants of the prohibitions.

SECTION 5.505 INDOOR MOISTURE CONTROL

5.505.1 Indoor moisture control. Buildings shall meet or exceed the provisions of *California Building Code*, CCR, Title 24, Part 2, Sections 1203 (Ventilation) and Chapter 14 (Exterior Walls). For additional measures not applicable to low-rise residential occupancies, see Section 5.407.2 of this code.

SECTION 5.506 INDOOR AIR QUALITY

5.506.1 Outside air delivery. For mechanically or naturally ventilated spaces in buildings, meet the minimum requirements of Section 120.1 (Requirements For Ventilation) of the 2013 *California Energy Code*, or the applicable local code, whichever is more stringent, and Division 1, Chapter 4 of CCR, Title 8.

5.506.2 Carbon dioxide (CO₂) monitoring. For buildings or additions equipped with demand control ventilation, CO₂ sensors and ventilation controls shall be specified and installed in accordance with the requirements of the 2013 *California Energy Code*, Section 120(c)(4).

SECTION 5.507 ENVIRONMENTAL COMFORT

5.507.4 Acoustical control. Employ building assemblies and components with Sound Transmission Class (STC) values determined in accordance with ASTM E90 and ASTM E413 or Outdoor-Indoor Sound Transmission Class (OITC) determined in accordance with ASTM E1332, using either the prescriptive or performance method in Section 5.507.4.1 or 5.507.4.2.

Exception: Buildings with few or no occupants or where occupants are not likely to be affected by exterior noise, as determined by the enforcement authority, such as factories, stadiums, storage, enclosed parking structures and utility buildings.

Exception: [DSA-SS] For public schools and community colleges, the requirements of this section and all subsections apply only to new construction.

5.507.4.1 Exterior noise transmission, prescriptive method. Wall and roof-ceiling assemblies exposed to the noise source making up the building or addition envelope

or altered envelope shall meet a composite STC rating of at least 50 or a composite OITC rating of no less than 40, with exterior windows of a minimum STC of 40 or OITC of 30 in the following locations:

1. Within the 65 CNEL noise contour of an airport.

Exceptions:

1. L_{dn} or CNEL for military airports shall be determined by the facility Air Installation Compatible Land Use Zone (AICUZ) plan.
2. L_{dn} or CNEL for other airports and heliports for which a land use plan has not been developed shall be determined by the local general plan noise element.
2. Within the 65 CNEL or L_{dn} noise contour of a freeway or expressway, railroad, industrial source or fixed-guideway source as determined by the Noise Element of the General Plan.

5.507.4.1.1 Noise exposure where noise contours are not readily available. Buildings exposed to a noise level of 65 dB L_{eq} -1-hr during any hour of operation shall have building, addition or alteration exterior wall and roof-ceiling assemblies exposed to the noise source meeting a composite STC rating of at least 45 (or OITC 35), with exterior windows of a minimum STC of 40 (or OITC 30).

5.507.4.2 Performance method. For buildings located as defined in Section 5.507.4.1 or 5.507.4.1.1, wall and roof-ceiling assemblies exposed to the noise source making up the building or addition envelope or altered envelope shall be constructed to provide an interior noise environment attributable to exterior sources that does not exceed an hourly equivalent noise level (L_{eq} -1Hr) of 50 dBA in occupied areas during any hour of operation.

5.507.4.2.1 Site features. Exterior features such as sound walls or earth berms may be utilized as appropriate to the building, addition or alteration project to mitigate sound migration to the interior.

5.507.4.2.2 Documentation of compliance. An acoustical analysis documenting complying interior sound levels shall be prepared by personnel approved by the architect or engineer of record.

5.507.4.3 Interior sound transmission. Wall and floor-ceiling assemblies separating tenant spaces and tenant spaces and public places shall have an STC of at least 40.

Note: Examples of assemblies and their various STC ratings may be found at the California Office of Noise Control: http://www.toolbase.org/PDF/CaseStudies/stc_icc_ratings.pdf.

SECTION 5.508 OUTDOOR AIR QUALITY

5.508.1 Ozone depletion and greenhouse gas reductions. Installations of HVAC, refrigeration and fire suppression equipment shall comply with Sections 5.508.1.1 and 5.508.1.2.

APPENDIX E

Manufacturer Data Sheets

**25HCC5
Performance™ 15 Heat Pump
with Puron® Refrigerant
1–1/2 To 5 Nominal Tons**

Product Data

Carrier's heat pumps with Puron® refrigerant provide a collection of features unmatched by any other family of equipment. The 25HCC5 has been designed utilizing Carrier's Puron refrigerant. The environmentally sound refrigerant allows consumers to make a responsible decision in the protection of the earth's ozone layer. This product has been designed and manufactured to meet Energy Star® criteria for energy efficiency when matched with appropriate coil components. Refer to the combination ratings in the Product Data for system combinations that meet Energy Star® guidelines.

NOTE: Ratings contained in this document are subject to change at any time. Always refer to the AHRI directory (www.ahridirectory.org) for the most up-to-date ratings information.

INDUSTRY LEADING FEATURES / BENEFITS

Efficiency

- 15.3 SEER/ 11.0 - 13.0 EER/ 7.7 - 9.0 HSPF (Nominal)
- Microtube Technology™ refrigeration system
- Indoor air quality accessories available

Sound

- Sound level as low as 68 dBA

Comfort

- System supports Thermidistat™ or standard thermostat controls

Reliability

- Puron® refrigerant - environmentally sound, won't deplete the ozone layer and low lifetime service cost.
- Front-seating service valves
- Scroll compressor
- Internal pressure relief valve
- Internal thermal overload
- High pressure switch
- Loss of charge switch
- Filter drier
- Balanced refrigeration system for maximum reliability

Durability

WeatherArmor™ protection package:

- Solid, durable sheet metal construction
- Steel louver coil guard
- Baked-on, complete coverage, powder paint

Applications

- Long-line - up to 250 feet (76.20 m) total equivalent length, up to 200 feet (60.96 m) condenser above evaporator, or up to 80 ft. (24.38 m) evaporator above condenser (See Longline Guide for more information.)
- Low ambient (down to -20°F/-28.9°C) with accessory kit

* Permissible limits of the voltage range at which the unit will operate satisfactorily

† If wire is applied at ambient greater than 30°C, consult table 310–16 of the NEC (ANSI/NFPA 70). The ampacity of non-metallic-sheathed cable (NM), trade name ROMEX, shall be that of 60°C conditions, per the NEC (ANSI/NFPA 70) Article 336–26. If other than uncoated (no-plated), 60 or 75°C insulation, copper wire (solid wire for 10 AWG or smaller, stranded wire for larger than 10 AWG) is used, consult applicable tables of the NEC (ANSI/NFPA 70).

‡ Length shown is as measured 1 way along wire path between unit and service panel for voltage drop not to exceed 2%.

** Time–Delay fuse.

FLA – Full Load Amps

LRA – Locked Rotor Amps

MCA – Minimum Circuit Amps

RLA – Rated Load Amps

NOTE: Control circuit is 24–V on all units and requires external power source. Copper wire must be used from service disconnect to unit.

All motors/compressors contain internal overload protection.

Complies with 2007 requirements of ASHRAE Standards 90.1

Acoustical Equipment Calibration Certificates

Calibration Certificate

Certificate Number 2018000194

Customer:

Eilar Associates
466 Blueridge Place
Escondido, CA 92026, United States

Model Number LxT SE
Serial Number 0004085
Test Results Pass
Initial Condition AS RECEIVED same as shipped
Description Sound Expert LxT
Class 1 Sound Level Meter
Firmware Revision: 2.302

Procedure Number D0001.8384
Technician Ron Harris
Calibration Date 4 Jan 2018
Calibration Due 4 Jan 2020
Temperature 23.33 °C ± 0.25 °C
Humidity 51.5 %RH ± 2.0 %RH
Static Pressure 86.97 kPa ± 0.13 kPa

Evaluation Method Tested with: Data reported in dB re 20 µPa.

Larson Davis PRMLxT1L S/N 035963
PCB 377B02 S/N 146849
Larson Davis CAL200 S/N 9079
Larson Davis CAL291 S/N 0203

Compliance Standards Compliant to Manufacturer Specifications and the following standards when combined with Calibration Certificate from procedure D0001.8378:

IEC 60651:2001 Type 1	ANSI S1.4-2014 Class 1
IEC 60804:2000 Type 1	ANSI S1.4 (R2006) Type 1
IEC 61252:2002	ANSI S1.11 (R2009) Class 1
IEC 61260:2001 Class 1	ANSI S1.25 (R2007)
IEC 61672:2013 Class 1	ANSI S1.43 (R2007) Type 1

Issuing lab certifies that the instrument described above meets or exceeds all specifications as stated in the referenced procedure (unless otherwise noted). It has been calibrated using measurement standards traceable to the International System of Units (SI) through the National Institute of Standards and Technology (NIST), or other national measurement institutes, and meets the requirements of ISO/IEC 17025:2005.

Test points marked with a ‡ in the uncertainties column do not fall within this laboratory's scope of accreditation.

The quality system is registered to ISO 9001:2008.

This calibration is a direct comparison of the unit under test to the listed reference standards and did not involve any sampling plans to complete. No allowance has been made for the instability of the test device due to use, time, etc. Such allowances would be made by the customer as needed.

The uncertainties were computed in accordance with the ISO Guide to the Expression of Uncertainty in Measurement (GUM). A coverage factor of approximately 2 sigma (k=2) has been applied to the standard uncertainty to express the expanded uncertainty at approximately 95% confidence level.

This report may not be reproduced, except in full, unless permission for the publication of an approved abstract is obtained in writing from the organization issuing this report.

Correction data from Larson Davis LxT Manual for SoundTrack LxT & SoundExpert LxT, I770.01 Rev J Supporting Firmware Version 2.301, 2015-04-30

Larson Davis, a division of PCB Piezotronics, Inc
1681 West 820 North
Provo, UT 84601, United States
716-684-0001

LARSON DAVIS
A PCB PIEZOTRONICS DIV.

For 1/4" microphones, the Larson Davis ADP024 1/4" to 1/2" adaptor is used with the calibrators and the Larson Davis ADP043 1/4" to 1/2" adaptor is used with the preamplifier.

Calibration Check Frequency: 1000 Hz; Reference Sound Pressure Level: 114 dB re 20 μ Pa

Periodic tests were performed in accordance with procedures from IEC 61672-3:2013 / ANSI/ASA S1.4-2014/Part3.

No Pattern approval for IEC 61672-1:2013 / ANSI/ASA S1.4-2014/Part 1 available.

The sound level meter submitted for testing successfully completed the periodic tests of IEC 61672-3:2013 / ANSI/ASA S1.4-2014/Part 3, for the environmental conditions under which the tests were performed. However, no general statement or conclusion can be made about conformance of the sound level meter to the full specifications of IEC 61672-1:2013 / ANSI/ASA S1.4-2014/Part 1 because (a) evidence was not publicly available, from an independent testing organization responsible for pattern approvals, to demonstrate that the model of sound level meter fully conformed to the class 1 specifications in IEC 61672-1:2013 / ANSI/ASA S1.4-2014/Part 1 or correction data for acoustical test of frequency weighting were not provided in the Instruction Manual and (b) because the periodic tests of IEC 61672-3:2013 / ANSI/ASA S1.4-2014/Part 3 cover only a limited subset of the specifications in IEC 61672-1:2013 / ANSI/ASA S1.4-2014/Part 1.

Peak Z-weight

Z-weighted peak sound level performed according to IEC 60651:2001 9.4.4 and ANSI S1.4:1983 (R2006) 8.4.4

Amplitude [dB]	Duration[μs]	Test Result [dB]	Lower limit [dB]	Upper limit [dB]	Expanded Uncertainty [dB]	Result
112.15	100	Negative Pulse	114.40	112.05	116.05	Pass
	100	Positive Pulse	114.35	111.99	115.99	
102.15	100	Negative Pulse	104.38	102.03	106.03	Pass
	100	Positive Pulse	104.34	101.99	105.99	
92.15	100	Negative Pulse	94.39	92.04	96.04	Pass
	100	Positive Pulse	94.34	92.00	96.00	
82.15	100	Negative Pulse	84.40	82.05	86.05	Pass
	100	Positive Pulse	84.34	82.01	86.01	

-- End of measurement results--

Overload Detector

Overload indication performed according to IEC 61672-3:2013 20 and ANSI S1.4-2014 Part 3: 20 for compliance to IEC 61672-1:2013 5.11, IEC 60804:2000 9.3.5, IEC 61252:2002 11, ANSI S1.4 (R2006) 5.8, and ANSI S1.4-2014 Part 1: 5.11, ANSI S1.25 (R2007) 7.6, ANSI S1.43 (R2007) 7

Measurement	Test Result [dB]	Lower limit [dB]	Upper limit [dB]	Expanded Uncertainty [dB]	Result
Positive	119.05	118.00	120.00	0.09	Pass
Negative	118.85	118.00	120.00	0.09	Pass
Difference	0.20	-1.50	1.50	0.09	Pass

-- End of measurement results--

Peak Rise Time

Peak rise time performed according to IEC 60651:2001 9.4.4 and ANSI S1.4:1983 (R2006) 8.4.4

Amplitude [dB]	Duration [μs]	Test Result [dB]	Lower limit [dB]	Upper limit [dB]	Expanded Uncertainty [dB]	Result
113.15	40	Negative Pulse	114.28	113.04	115.04	Pass
		Positive Pulse	114.41	112.96	114.96	Pass
	30	Negative Pulse	113.60	113.04	115.04	Pass
		Positive Pulse	113.52	112.96	114.96	Pass

-- End of measurement results--

Positive Pulse Crest Factor

200 μ s pulse tests at 2.0, 12.0, 22.0, 32.0 dB below Overload Limit

Crest Factor measured according to IEC 60651:2001 9.4.2 and ANSI S1.4:1983 (R2006) 8.4.2

Amplitude [dB]	Crest Factor	Test Result [dB]	Limits [dB]	Expanded Uncertainty [dB]	Result
114.15	3	OVLD	± 0.50	0.09	Pass
	5	OVLD	± 1.00	0.09	Pass
	10	OVLD	± 1.50	0.09	Pass
104.15	3	-0.10	± 0.50	0.09	Pass
	5	-0.11	± 1.00	0.11	Pass
	10	OVLD	± 1.50	0.09	Pass
94.15	3	-0.08	± 0.50	0.09	Pass
	5	-0.07	± 1.00	0.09	Pass
	10	-0.24	± 1.50	0.09	Pass
84.15	3	-0.08	± 0.50	0.09	Pass
	5	-0.06	± 1.00	0.09	Pass
	10	0.07	± 1.50	0.09	Pass

-- End of measurement results--

Negative Pulse Crest Factor

200 μ s pulse tests at 2.0, 12.0, 22.0, 32.0 dB below Overload Limit

Crest Factor measured according to IEC 60651:2001 9.4.2 and ANSI S1.4:1983 (R2006) 8.4.2

Amplitude [dB]	Crest Factor	Test Result [dB]	Limits [dB]	Expanded Uncertainty [dB]	Result
114.15	3	OVLD	± 0.50	0.09	Pass
	5	OVLD	± 1.00	0.09	Pass
	10	OVLD	± 1.50	0.09	Pass
104.15	3	-0.06	± 0.50	0.09	Pass
	5	-0.05	± 1.00	0.09	Pass

94.15	3	-0.07	± 0.50	0.09	Pass
	5	-0.06	± 1.00	0.09	Pass
	10	-0.20	± 1.50	0.09	Pass
84.15	3	-0.06	± 0.50	0.09	Pass
	5	-0.04	± 1.00	0.09	Pass
	10	0.08	± 1.50	0.09	Pass

-- End of measurement results--

Tone Burst

2kHz tone burst tests at 2.0, 12.0, 22.0, 32.0 dB below Overload Limit

Tone burst response measured according to IEC 60651:2001 9.4.2 and ANSI S1.4:1983 (R2006) 8.4.2

Amplitude [dB]	Crest Factor	Test Result [dB]	Limits [dB]	Expanded Uncertainty [dB]	Result
114.15	3	OVLD	± 0.50	0.09	Pass
	5	OVLD	± 1.00	0.09	Pass
104.15	3	-0.06	± 0.50	0.09	Pass
	5	-0.04	± 1.00	0.09	Pass
94.15	3	-0.06	± 0.50	0.09	Pass
	5	-0.05	± 1.00	0.09	Pass
84.15	3	-0.06	± 0.50	0.09	Pass
	5	-0.01	± 1.00	0.09	Pass

-- End of measurement results--

Impulse Detector - Repeat

Impulse Detector measured according to IEC 60651:2001 9.4.3 and ANSI S1.4:1983 (R2006) 8.4.3

Amplitude [dB]	Repetition Rate [Hz]	Test Result [dB]	Lower limit [dB]	Upper limit [dB]	Expanded Uncertainty [dB]	Result
116.15	100.00	-2.78	-3.71	-1.71	0.09	Pass
	20.00	-7.58	-9.57	-5.57	0.16	Pass
	2.00	-8.93	-10.76	-6.76	0.09	Pass
Step	2.00	5.00	4.00	6.00	0.09	Pass

-- End of measurement results--

Impulse Detector - Single

Impulse Detector measured according to IEC 60651:2001 9.4.3 and ANSI S1.4:1983 (R2006) 8.4.3

Amplitude [dB]	Duration [ms]	Test Result [dB]	Lower limit [dB]	Upper limit [dB]	Expanded Uncertainty [dB]	Result
116.15	20.00	-3.65	-5.11	-2.11	0.09	Pass
	5.00	-8.90	-10.76	-6.76	0.10	Pass
	2.00	-12.84	-14.55	-10.55	0.11	Pass
Step	2.00	9.72	9.00	11.00	0.11	Pass

-- End of measurement results--

Gain

Gain measured according to IEC 61672-3:2013 17.3 and 17.4 and ANSI S1.4-2014 Part 3: 17.3 and 17.4

Measurement	Test Result [dB]	Lower limit [dB]	Upper limit [dB]	Expanded Uncertainty [dB]	Result
0 dB Gain	84.02	83.90	84.10	0.09	Pass
0 dB Gain, Linearity	20.47	20.30	21.70	0.15	Pass
OBA Low Range	84.00	83.90	84.10	0.09	Pass
OBA Normal Range	84.00	83.20	84.80	0.09	Pass

-- End of measurement results--

1/3-Octave Self-Generated Noise

The SLM is set to low range.

Frequency [Hz]	Test Result [dB]	Upper limit [dB]	Result
6.30	9.41	16.30	Pass

Test Results	Pass	Calibration Date	4 Jan 2018
Initial Condition	AS RECEIVED same as shipped	Calibration Due	4 Jan 2020
Description	Larson Davis 1/2" Preamplifier for LxT Class 1 -1 dB	Temperature	23.12 °C ± 0.01 °C
		Humidity	52.2 %RH ± 0.5 %RH
		Static Pressure	86.91 kPa ± 0.03 kPa
Evaluation Method	Tested electrically using a 12.0 pF capacitor to simulate microphone capacitance. Data reported in dB re 20 µPa assuming a microphone sensitivity of 50.0 mV/Pa.		
Compliance Standards	Compliant to Manufacturer Specifications		

Issuing lab certifies that the instrument described above meets or exceeds all specifications as stated in the referenced procedure (unless otherwise noted). It has been calibrated using measurement standards traceable to the SI through the National Institute of Standards and Technology (NIST), or other national measurement institutes, and meets the requirements of ISO/IEC 17025:2005. Test points marked with a ‡ in the uncertainties column do not fall within this laboratory's scope of accreditation.

The quality system is registered to ISO 9001:2008.

This calibration is a direct comparison of the unit under test to the listed reference standards and did not involve any sampling plans to complete. No allowance has been made for the instability of the test device due to use, time, etc. Such allowances would be made by the customer as needed.

The uncertainties were computed in accordance with the ISO Guide to the Expression of Uncertainty in Measurement (GUM). A coverage factor of approximately 2 sigma (k=2) has been applied to the standard uncertainty to express the expanded uncertainty at approximately 95% confidence level.

This report may not be reproduced, except in full, unless permission for the publication of an approved abstract is obtained in writing from the organization issuing this report.

Certificate of Calibration and Conformance

Certificate Number 2017-205701

Instrument Model 720, Serial Number 0309, was calibrated on 22 Sep 2017. The instrument meets factory specifications per Procedure D0001.8208, ANSI S1.4 1983, IEC 651-Type 2 1979, and IEC 804-Type 2 1985.

Instrument found to be in calibration as received: YES

Date Calibrated: 22 Sep 2017

Calibration due: 22 Sep 2019

Calibration Environmental Conditions

Temperature: 23 ° Centigrade

Relative Humidity: 30 %

Affirmations

This Certificate attests that this instrument has been calibrated under the stated conditions with Measurement and Test Equipment (M&TE) Standards traceable to the U.S. National Institute of Standards and Technology (NIST). All of the Measurement Standards have been calibrated to their manufacturers' specified accuracy / uncertainty. Evidence of traceability and accuracy is on file at Provo Engineering & Manufacturing Center. An acceptable accuracy ratio between the Standard(s) and the item calibrated has been maintained. This instrument meets or exceeds the manufacturer's published specification unless noted.

The collective uncertainty of the Measurement Standard used does not exceed 25% of the applicable tolerance for each characteristic calibrated unless otherwise noted.

The results documented in this certificate relate only to the item(s) calibrated or tested. A one year calibration is recommended, however calibration interval assignment and adjustment are the responsibility of the end user. This certificate may not be reproduced, except in full, without the written approval of the issuer.

"AS RECEIVED" data same as shipped data.

Larson Davis Microphone and Preamp Data

Model: MIC001 Serial Number: 1029

Sensitivity @ 1 KHz: 8.08 mV/Pa

Test Conditions:

Powered by LD Spark 706RC. Compared to PCB 377A13 microphone in Larson Davis CAL291. Corrected to 0° free field response. Data taken with LD 2900.

2900 Serial Number: 0249

CAL291 Serial Number: 0128

377A13 Serial Number: 134649

Spark 706RC Serial Number: 17000

Tested by Eric Olson on 7SEP2017

Sound Level Meter Model: 720 Serial Number: A0309

Log Linearity, Differential Linearity and Range Data

This Type 2 Sound Level Meter (including integral PRM789 preamplifier and ADP018 4.7 pF input adapter) was calibrated with a reference 1kHz sine wave at a level of 114.0 dB SPL. The instrument's Log Linearity A-weighted fast response was then electrically tested using a 1kHz sine wave from 26.5 dB SPL to 146.5 dB SPL in 0.5 dB increments.

Plotted per typical sensitivity of an M1 3/8" electret microphone; 16.7 mV/Pa & 4.7 pF.

Overload occurs at 141.9 dB SPL.

Primary indicator range: 107.8 dB (lower limit: 34.0 dB SPL to upper limit: 141.8 dB SPL).

Dynamic range: 112.1 dB (noise floor: 29.7 dB SPL to upper limit: 141.8 dB SPL).

This instrument is in compliance with IEC 60651 (2001-10) 7.9 and 7.10, ANSI S1.4-1983 3.2 and IEC 60804 (2001-10) 9.2.1 for Type 2 sound level meters when used with a Larson Davis Type 2 microphone.

Technician: Eric Olson

Test Date: 22SEP2017

Sound Level Meter Model: 720 Serial Number: A0309

Certificate of A-Weight Electrical Conformance

This Type 2 Sound Level Meter (including integral PRM789 preamplifier and ADP018 4.7 pF input adapter) was calibrated with a reference 1kHz sine wave at a level of 114.0 dBSPL. The instrument's A-weighted response was then electrically tested using a 3.0 Vrms sinewave at exact frequencies as specified in IEC 60651 (2001-10) and ANSI S1.4-1983.

This instrument is in compliance with IEC 60651 (2001-10) 6.1 and 9.2.2, ANSI S1.4-1983 5.1 and 8.2.1, and IEC 60804 (2001-10) 5.1 for Type 2 sound level meters when used with a Larson Davis Type 2 microphone.

Technician: Eric Olson Test Date: 22SEP2017

Calibration Certificate

Certificate Number 2017004806

Customer:

Eilar Associates
466 Blueridge Place
Escondido, CA 92026, United States

Model Number CAL150B
Serial Number 2056
Test Results Pass
Initial Condition Adjusted
Description Larson Davis CAL150B Calibrator

Procedure Number D0001.8386
Technician Scott Montgomery
Calibration Date 9 May 2017
Calibration Due 9 May 2019
Temperature 23 °C ± 0.3 °C
Humidity 39 %RH ± 3 %RH
Static Pressure 101.3 kPa ± 1 kPa

Evaluation Method The data is acquired by the insert voltage calibration method using the reference microphone's open circuit sensitivity. Data reported in dB re 20 µPa.

Compliance Standards Compliant to Manufacturer Specifications per D0001.8190 and the following standards:
IEC 60942:2003 ANSI S1.40-2006

Issuing lab certifies that the instrument described above meets or exceeds all specifications as stated in the referenced procedure (unless otherwise noted). It has been calibrated using measurement standards traceable to the SI through the National Institute of Standards and Technology (NIST), or other national measurement institutes, and meets the requirements of ISO/IEC 17025:2005. Test points marked with a ‡ in the uncertainties column do not fall within this laboratory's scope of accreditation.

The quality system is registered to ISO 9001:2008.

This calibration is a direct comparison of the unit under test to the listed reference standards and did not involve any sampling plans to complete. No allowance has been made for the instability of the test device due to use, time, etc. Such allowances would be made by the customer as needed.

The uncertainties were computed in accordance with the ISO Guide to the Expression of Uncertainty in Measurement (GUM). A coverage factor of approximately 2 sigma (k=2) has been applied to the standard uncertainty to express the expanded uncertainty at approximately 95% confidence level.

This report may not be reproduced, except in full, unless permission for the publication of an approved abstract is obtained in writing from the organization issuing this report.

Continuous Service and Quality

Reese Enterprises, Inc. has more than 80 years experience in manufacturing weatherstrips along with many other door & floor products. During that time, we have devoted both time and dollars to product development, research and testing. Our highest valued asset, however, is you — our customer. That's why you'll talk to a pleasant, helpful person when you call Reese. No answering machines or recorded menus. Call us and hear for yourself.

DRAFT & ACOUSTICAL SOUND SEALANT

SC175

DESIGNED FOR USE ON SOUND-RATED WALL SYSTEMS

OSI SC175 Draft & Acoustical Sound Sealant is a non-flammable, latex-based sealant specially designed to reduce sound transmissions and drafts in all types of wall systems where a sound-rated assembly is required. Its primary function is to achieve and maintain the specific STC (Sound Transmission Class) value of the system designed. This paintable sealant remains flexible and adheres firmly to wood, metal studs, concrete, gypsum board and most other building materials. It is easy-to-use and cleans up easily with soap and water.

Available As:

Item #	Size	Color
1496542	28 fl oz (828 ml) cartridge	White

FEATURES & BENEFITS

- Designed for Use on Sound-Rated Wall Systems
- Reduces Draft & Sound Transmission
- Tested to UL 1479 and UL 2079 *
- Tested to ASTM E84
- Stays Permanently Flexible
- VOC Compliant

RECOMMENDED FOR

- Developed primarily for commercial construction utilizing light weight cavity walls and floor systems
- Used for exposed and unexposed applications at perimeter joints, floor and ceiling runners, cutouts in gypsum board, veneer plaster systems and other areas where a sound rated assembly is required
- Sealant can also be applied or buttered around all electrical boxes and outlets, cold air returns, heating and air conditioning ducts and other utility equipment penetrating wall surfaces for increased acoustical performance
- Works well for sealing sill and base plates in residential construction and non-fire rated systems

LIMITATIONS

- SC175 must be applied in accordance with ASTM C919 (Standard Practice for Use of Sealants in Acoustical Applications)
- Non-fire rated and fire rated systems. Refer to UL Fire Resistance Directory for testing details *
- Not for use in underwater applications or permanent water immersion
- Do not use in applications requiring temperature resistance greater than 170°F
- Do not use on metals that will corrode
- Consult with manufacturer of adjoining materials for compatibility, including CPVC materials
- Not recommended for bonding two non-porous surfaces
- Not recommended for use with polyethylene, polypropylene, polytetrafluoroethylene (PTFE)/Teflon® or nylon

COVERAGE

For a 28 fl. oz. (825 ml) cartridge:

• A 1/4" (6 mm) bead extrudes approximately 86 ft. (26 m)

• A 3/8" (9.5 mm) bead extrudes approximately 38 ft. (12 m)

Specifications:

Tested to or conforms to:

- **ASTM C834** – Standard Specification for Latex Sealants
 - **ASTM E84, Class A** – Standard Test Method for Surface Burning Characteristics of Building Materials (Tested at UL under research project)
 - **ASTM E90** – Standard Test Method for Laboratory Measurement of Airborne Sound Transmission Loss of Building Partitions and Elements
 - **ASTM C919** – Standard Practice for Use of Sealants in Acoustical Applications
 - **ASTM D217** – Standard Test Methods for Cone Penetration of Lubricating Grease
 - **UL 1479** (ASTM E814) – Standard for Fire Tests of Penetration Firestops
 - **UL 2079** (ASTM E1966) – Standard for Tests for Fire Resistance of Building Joint Systems
 - GreenGuard® Certified
- * Refer to UL Fire Resistance Directory for design systems

DIRECTIONS

Tools Typically Required:

Utility knife, caulking gun and tool to puncture inside seal of cartridge.

Safety Precautions:

Wear gloves.

Preparation:

The temperature of the product, the surfaces and the working area must be above 40°F (4°C). For best performance, apply sealant at 70°F (21°C). Ensure surfaces to be sealed are clean, dry, structurally sound and free of dust, grease, oil, and other foreign contaminants. Cut off tip of cartridge at a 45° angle to desired bead size (3/8" recommended). Puncture inside seal of cartridge.

Application:

Sealant should be applied as specified in the sound-rated system being installed (either wood or metal studs). Sealant must be applied in accordance with ASTM C 919. Maximum joint size should not exceed 5/8" (15.9 mm) width x 1/2" (12.7 mm) depth. If necessary, sealant can be painted as applicable to meet project requirements after 24 hours.

Bottom and Top Runners:

Apply a continuous 3/8" (9.5 mm) round bead of sealant on runners before setting gypsum board. Press gypsum board firmly into sealant, ensuring complete contact with adjacent materials. Fill joint on top runners to complete the seal. Repeat procedure for double-layer applications.

Cut-Outs and Perimeter Joints:

Backs of electrical boxes, pipes, duct systems and other types of utility equipment penetrating wall surfaces shall be buttered with sealant. Seal all joints at perimeter edges including abutting surfaces and corner joints.

For further application information, refer to ASTM C919 - Standard Practice for Use of Sealants in Acoustical Applications.

Clean-up:

Clean tools and uncured adhesive residue immediately with warm water and soap. Cured sealant may be carefully cut away with a sharp-edged tool.

STORAGE & DISPOSAL

DAMAGED BY FREEZING. Store in a cool, dry location at room temperature. For maximum shelf life store at 75°F (24°C). Take unwanted product to an approved household hazardous waste transfer facility. Hardened material may be disposed of with

LABEL PRECAUTIONS

CAUTION! Contains ethylene glycol, mineral spirits, and crystalline silica. May cause skin, eye and respiratory irritation. Avoid contact with eyes and skin. Avoid breathing vapors. Use with adequate ventilation. Do not swallow. **FIRST AID:** If swallowed do not induce vomiting, call a physician or Poison Control center immediately. For eye contact, flush with water for 15 minutes, call a physician. For skin contact, wash thoroughly with soap and water. **KEEP OUT OF REACH OF CHILDREN.**

WARNING: Cancer and Reproductive Harm – www.P65Warnings.ca.gov.

Refer to the Safety Data Sheet (SDS) for further information.

LIMITED WARRANTY

This product is warranted to be free from defects in materials when used as directed. Henkel's sole obligation shall be, at its option, to replace or refund the purchase price of product proven to be defective. Henkel makes no other warranty, express or implied, including warranties of MERCHANTABILITY and FITNESS FOR A PARTICULAR PURPOSE and will not be liable for consequential or incidental damages. This limited warranty gives you specific legal rights, which vary from state to state

DISCLAIMER

The information and recommendations contained herein are based on our research and are believed to be accurate, but no warranty, express or implied, is made or should be inferred. Henkel recommends purchasers/users should test the products to determine acceptable quality and suitability for the intended use. All adhesive/sealant applications should be tested under simulated or actual end use conditions to ensure the adhesive/sealant meets or exceeds all required project specifications. Since assembly conditions may be critical to adhesive/sealant performance, it is also recommended that testing be performed on specimens assembled under simulated or actual production conditions. Nothing contained herein shall be construed to imply the nonexistence of any relevant patents or to constitute a permission, inducement or recommendation to practice any invention covered by any patent, without authority from the owner of the patent.

OSI Tougher than the Elements. For Professional Use Only. The Battle will be Fierce.

OSI works side by side with residential builders, contractors and remodeling professionals who use our products every day on their jobsites. OSI combines this deep understanding with the sophisticated global innovation and manufacturing excellence of Henkel to make the world's best professional-grade caulks, sealants and adhesives.

AC-20 FTR®

(Fire & Temperature Rated) Acoustical & Insulation Sealant

Specification Data Sheet

BASIC USES

• AC-20 FTR® fire-rated systems are suitable for applications in schools, hospitals, churches, high-rise office buildings and hotels, prisons, sports arenas, and other public-use buildings to ensure a safe and orderly evacuation in the event of a fire.

2. MANUFACTURER

Pecora Corporation
165 Wambold Road
Harleysville, PA 19438
Phone: 215-723-6051
800-523-6688
Fax: 215-721-0286
Website: www.pecora.com

3. PRODUCT DESCRIPTION

AC-20 FTR® is a unique acrylic latex sealant that is UL® Classified in firestopping systems for expansion joints and through penetrations. When properly installed, these systems effectively contain fire, smoke, toxic fumes, and water within a given area surrounded by firewalls for a two, three, or four hour period, depending on the design specifications.

Other Uses: Excellent adhesive, flexibility and durability qualities make AC-20 FTR® ideal for insulating and weatherproofing around windows, doors, panels, siding, duct work, base plates, etc. It is compatible with all common building materials including specialties such as polystyrene, polyurethane, cork, vinyl, foamed and fibrous glass.

Used as an acoustical sealant, AC-20 FTR® reduces sound transmission in partition systems to achieve specific STC values by sealing spaces around cut-outs and at perimeters of partitions. The sealant cures to a tough rubber to form a long-lasting acoustical seal.

PACKAGING

- 30 fl. oz. (.887 liter) fiber cartridges
- 5-gallon (18.9 liter) pails

COLOR

- White, Beige-Gray
- Special colors available in 250-gallon (946 liter) batches.

4. TECHNICAL DATA

Applicable Standards: ASTM C-834-86 specification for latex sealing compounds.

Fire Rated System: Two-hour Fire and Temperature Rated wall and floor joint systems up to 7" (178mm) wide and four-hour systems up to 4" wide can be designed with AC-20 FTR® in conjunction with Ultra Block fire blocking material in fire-rated walls and floors. Reference: ANSI/UL 263, ASTM E-119, NFPA No. 251.

AC-20 FTR® in conjunction with Ultra Block® achieves a 2-hour fire rating when sealing around steel or copper pipe and electrical metallic tubing or steel conduit in through penetration systems. Reference: ANSI/UL 1479, ASTM E-814.

FILL, VOID OR CAVITY MATERIALS
CLASSIFIED BY
UNDERWRITERS
LABORATORIES INC.
FOR USE IN
THROUGH-PENETRATION
FIRESTOP SYSTEM NO. CAJ 1093

In addition to its fire-blocking value, Ultra Block® is very efficient acoustically, having a noise reduction coefficient of .75 and sound transmission coefficient of .5 (Ultra Block® is a registered trademark of Backer Rod Mfg. and Supply Co., Denver, CO, USA.)

5. INSTALLATION

Surface Preparation: Surfaces must be free of all contamination. Sealant may be applied to damp, porous surfaces. No priming is required.

Application: Refer to Pecora Firestopping Manual 07270 and UL Fire Resistance Directory for installation details on fire-rated joint and through penetration systems. For insulating and weatherproofing purposes, fill all window, door, and panel perimeter joints using a resilient backer rod to control sealant depth to 1/2" (13mm) maximum. For best results, protect sealant from excessive low temperatures and apply above 40°F (4°C). For acoustical purposes, apply continuous

TYPICAL PHYSICAL PROPERTIES

Test Property	Value	Procedure
Modulus @ 100% (psi)	15-20	ASTM D412
Ultimate Tensile (psi)	30-40	ASTM D412
Ultimate Elongation (%)	400-500	ASTM D412
Movement Capability (%)	±7 1/2	ASTM D412
VOC Content	31 g/L	

beads of sealant to seal perimeters of all sound-rated partitions. Apply sealant in the angles formed by metal components or base-layer panels and abutting surfaces. Apply sealant around all openings formed for outlets; electrical, telephone, light fixtures, etc.

Tooling: Tool material flush with surfaces to allow for expected shrinkage and insure good contact and adhesion to the substrate.

Cleaning: Remove excess material with water or a damp cloth before it cures. Sealant may be painted within 30 minutes after application with a good grade of latex paint.

Shelf Life: AC-20 FTR® has a shelf life well in excess of one year when stored in unopened containers below 80° F (27°C).

Precautions: AC-20 FTR® is non-flammable, non-toxic, non-irritating and environmentally safe. However, do not take internally. Refer to Material Safety Data Sheet for additional information.

Ultra Block® is a non-carcinogenic processed continuous filament textile glass fiber that may cause skin, eye and respiratory irritation. When applying, wear long sleeves, gloves, cap, goggles or safety glasses and NIOSH/MSHA-approved dust respirator. After use bathe with soap and warm water. Wash clothes separately and rinse after use. Refer to Material Safety Data Sheet for additional information.

**FOR PROFESSIONAL USE ONLY.
KEEP OUT OF THE REACH
OF CHILDREN.**

6. AVAILABILITY AND COST

Pecora products are available from our stocking distributors in all major cities. For the name and telephone number of your nearest representative call one of our locations listed below or visit our website at www.pecora.com.

7. WARRANTY

Pecora Corporation warrants its products to be free of defects. Under this warranty, we will provide, at no charge, replacement materials for, or refund the purchase price of, any product proven to be defective when installed in accordance with our published recommendations and in applications considered by us as suitable from this product. This warranty in lieu of any and all other warranties expressed or implied, and in no case will Pecora be liable for incidental or consequential damages.

8. MAINTENANCE

If the sealant is damaged and the bond is intact, cut out the damaged area and recaulk. No primer is required. If the bond has been affected, remove the sealant, clean and prepare the joint in accordance with instructions under "Installation".

9. TECHNICAL SERVICES

Pecora representatives are available to assist you in selecting an appropriate product and to provide on-site application instructions or to conduct jobsite inspections. For further assistance call our Technical Service Department at 800-523-6688.
